ASHEVILLE: 1957

WEATHER SUMMARY

Several dry northers whistled across the Plains during January. They kicked up considerable dust, brought some fifty-degree temperature drops, but produced only scanty precipitation. They held the fruit buds in check, delayed the top growth of small grains, and forced cattlemen to increase the already heavy supplemental feed rations for their livestock. Timely rains over the eastern half of the State improved the pasture feed prospects and revived the hopes for a small-grain crop.

The showers in the Panhandle on the 3d and 4th were too light to bring any real benefit to crops. Large areas in the High and Low Plains, Edwards Plateau, Trans-Pecos, and south Texas remained critically dry. The unseasonal warm temperatures during the first week of January stimulated small grain growth in the Cross Timbers, Blacklands, and Upper Coast counties. The first dry norther of the year crossed the Plains on the 9th and 10th. Winds up to 70 miles per hour dropped the temperatures sharply--as much as 35 degrees in an hour in some localities--and kicked up dust storms in west Texas and the Panhandle. Freezing temperatures occurred as far south as Waco. The cool weather in the northwest prevented the winter wheat from greening. Dryland wheat in the Panhandle put down feeder roots but low temperatures held back top growth. Much of the dryland wheat needed rain to continue to survive. Shirt-sleeve weather returned quickly and afternoon temperatures on the 12th and 13th reached the 70s and 80s over much of the State.

The second norther hit the State near the middle of the month. It sent the livestock scurrying for shelter and stopped the field work abruptly. Temperatures over the Panhandle plunged to near zero on the morning of the 16th and freezing temperatures covered all but the southern tip of Texas. The first hard freeze arrived from Austin southward just in time to check the swelling fruit buds. The light snow flurries in the Panhandle contained little moisture. Dryland wheat continued on the downgrade but irrigated wheat looked promising. From Wichita Falls eastward across the northern Cross Timbers and Blacklands, small grains made good growth in response to the December rains over that area, and furnished grazing for livestock. Small grains, mostly oats, provided limited grazing in central and east Texas. The luxuriant stands of oats in the coastal country were heavily grazed. Drought continued over the Trans-Pecos, Edwards Plateau, and south Texas. Temperatures rose and mild weather prevailed at the end of the third week of January.

The third norther pushed into the Panhandle on the evening of the 24th. Early morning temperatures on the 25th were near zero and afternoon temperatures were mostly in the 20s. Warm moist air aloft brought light rains and drizzle to much of the State. The fog and icy drizzle delayed all farm work except the most urgent chores. In spite of promising clouds, the arid Plains continued dry. Hopes faded for dryland crops and many farmers chiseled their fields to prevent soil blowing. The low temperatures held the irrigated wheat in the dormant stage. Prospects brightened over the eastern half of Texas. Half-inch to two-inch rains soaked into the ground with little runoff. Oats made good root development but low temperatures held top growth to a standstill. Light showers in the Edwards Plateau settled the dust and enabled the grain crops to hang on a little longer. The Lower Valley desperately needed soaking rains before the cotton planting season.

Cattle and sheep were maintained in good condition by heavy supplemental feeding. Participation in the emergency hay and grain feeding programs continued heavy. Vegetable crops for late harvest in the Winter Garden were in good condition.

Monthly mean temperatures ranged from 30.2 degrees at Follett to 67.0 degrees at Port Isabel. In general, temperatures averaged slightly above the long-term January means at most southern stations and slightly below the long-term means at most northern stations. Most stations registered their highest temperatures on the 8th, 9th, 10th, 12th, or 13th. Monthly maximums ranged from the upper 60s over the northern High Plains to the 90s in the Lower Rio Grande Valley. The highest temperature for the State, 95 degrees, occurred at Encinal 3NW on the 9th. Two brief periods were especially cold. Low temperatures occurred over almost the entire State from the 14th to the 18th and most stations registered their lowest temperatures for the month during that period. The other especially cold period began on the 23d. The period 25th to 27th was very cold over the Panhandle. Several Panhandle stations registered their lowest temperatures for the month on the 24th or 25th. The coldest temperature for the State, one degree above zero, occurred at Follett and Spearman on the 25th. Sub-freezing temperatures occurred over the entire State except the Lower Valley. Monthly minimums at stations in the Lower Valley were only slightly above freezing.

Monthly precipitation totals ranged up to 6.21 inches at Center. Several stations in the extreme east central and the extreme northeast received more than four inches. Rainfall over the north central section and over the eastern sections received more than one inch. The Plains, Edwards Plateau, Trans-Pecos, and south Texas all received less than one inch. Parts of the Plains, Trans-Pecos, and south Texas received less than one-fourth inch, and a few scattered stations received no rain. Precipitation at a few scattered stations in the northern part of Texas exceeded the long-term means. Elsewhere, rainfall was deficient. Snowfall was of little consequence except in the Panhandle. A few Panhandle stations received more than an inch. The greatest amount, 4.2 inches, fell at Pampa.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent samples published in Table 7 are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One to nine days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

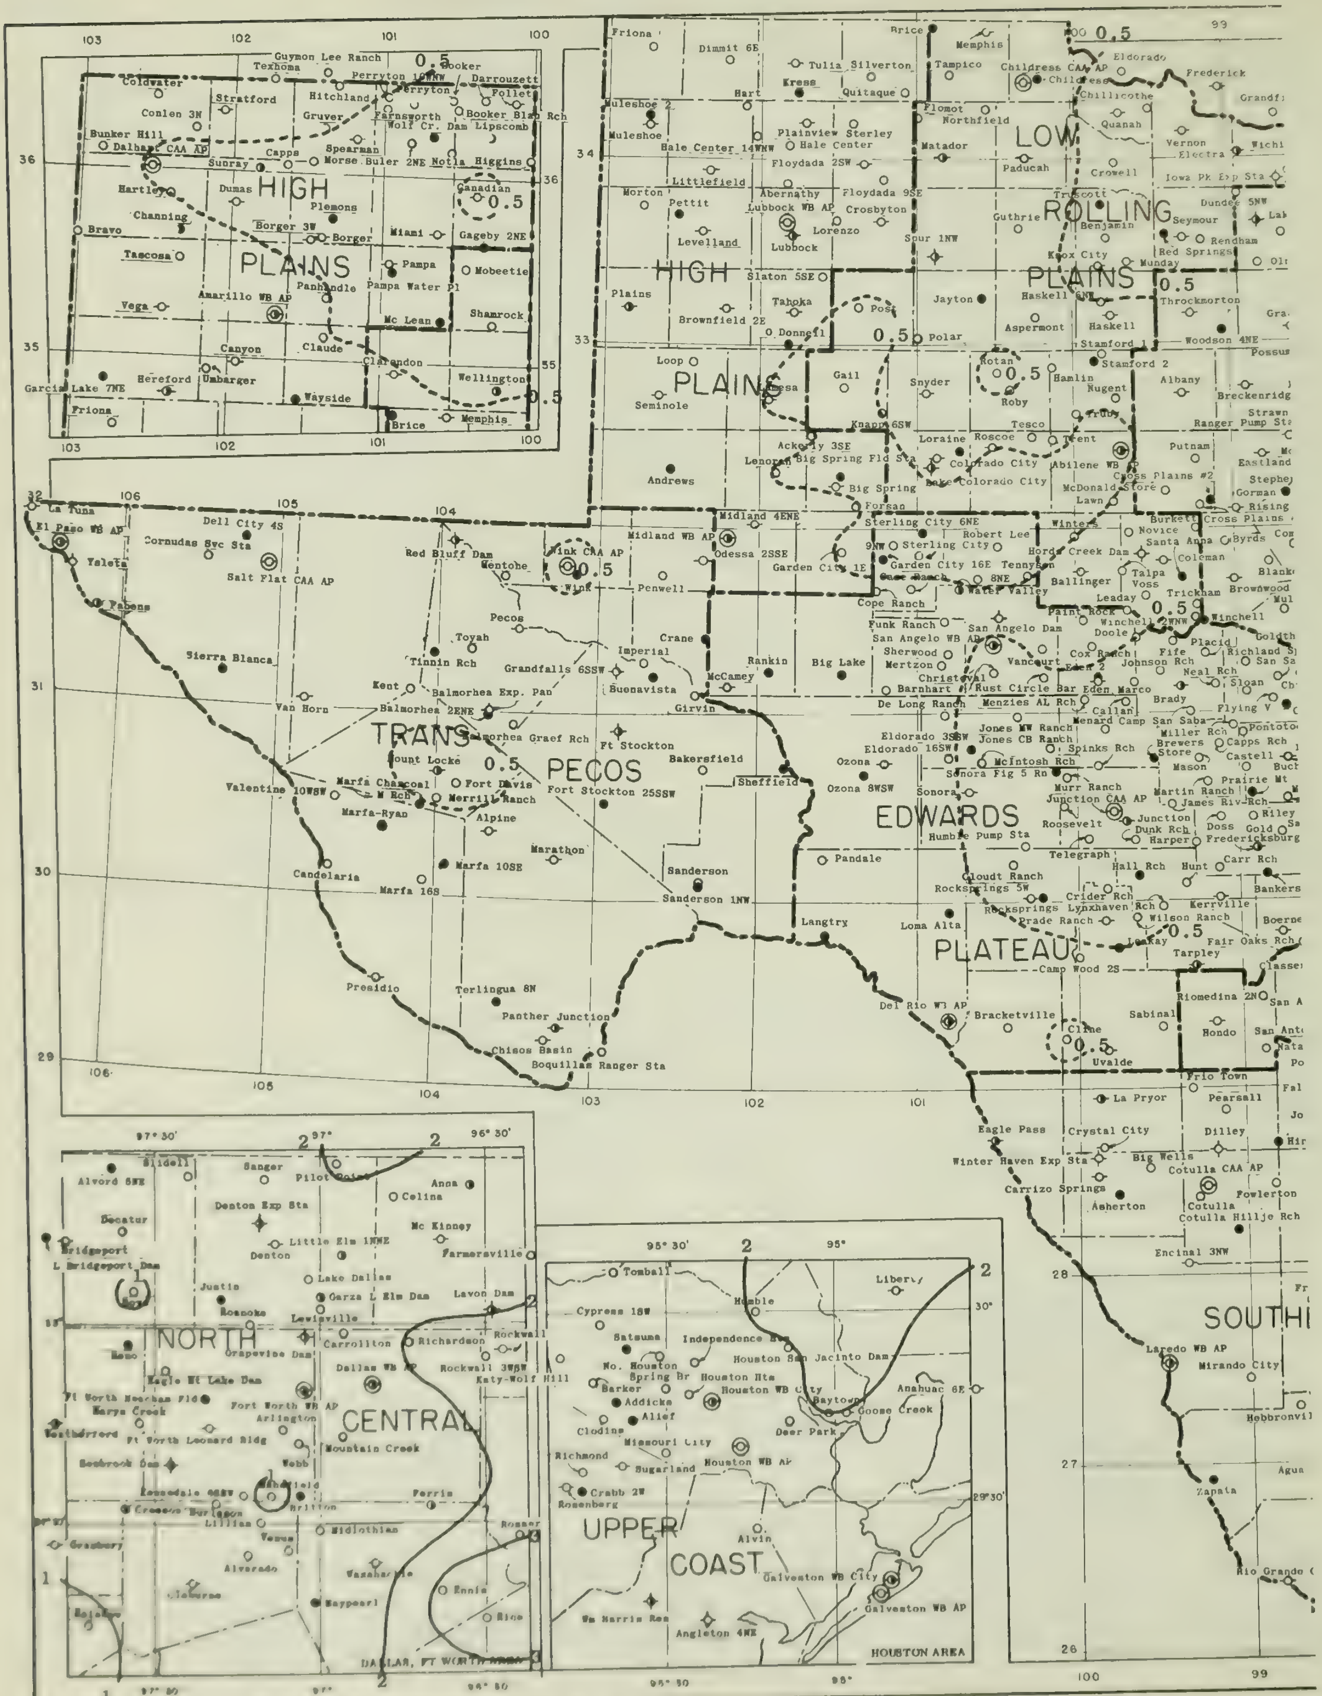
Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 3-12-57 -- 1650

TOTAL PRECIPITATION

JANUARY 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

FEBRUARY 1957
Volume LXII No. 2

THE LIBRARY OF THE
APR 23 1957
UNIVERSITY OF ILLINOIS

ASHEVILLE: 1957

WEATHER SUMMARY

Optimism returned to farmers and stockmen as mild temperatures and gentle penetrating rains brought the greatest improvement in prospects for pastures and crops in several years.

For many stations, February 1957 was the warmest February of record. Temperatures at El Paso averaged 8.5° above the February normal. At that station it was the warmest February in the 77 years of record. Only on the 19th was the daily mean temperature at El Paso below the daily normal. On that date it was only 1° below normal. The first two weeks of February were mild over the entire State. The period 8th to 15th was especially mild with temperatures averaging about 20° above seasonal. Almost all stations registered their highest maximum temperatures for the month during that period. A few stations in the northern High Plains, Mt. Locke in the Trans-Pecos, and several stations along the Upper Coast registered monthly maximums in the upper 70's. Most stations in the northern and western sections of Texas registered monthly maximums in the 80's. Numerous stations in central and southern Texas registered monthly maximum temperatures in the 90's. The highest temperature for the State, 96° occurred at Eagle Pass on February 10.

A cool front moved into the Panhandle on the 15th and downstate on the 16th. Temperatures dropped only slightly over the extreme west but considerably over other portions of Texas. A few stations in the High Plains and the Trans-Pecos registered their lowest temperatures for the month on the 1st or 2d. Most stations in the Plains and other parts of Texas, except the Trans-Pecos, registered their lowest temperatures during the last eight days of February. Monthly minimums were below freezing over the northern portions of Texas. The coldest temperature for the State, 8°, occurred at Follett on the 23d. Monthly minimums were near freezing over the central counties, in the upper 30's and in the 40's farther south, except at Port Isabel where the lowest minimum was 55°. Monthly mean temperatures ranged from 41.8° at Follett to 70.4° at Port Isabel. Monthly mean temperatures were above the long-term means at all stations. Temperature departures at most stations were between +4.0° and +8.0°. At several Weather Bureau stations, it was the warmest February in the last quarter century.

Some locally heavy showers fell over the Low Rolling Plains and Cross Timbers and lighter amounts over the Blacklands and East Texas during the first ten days. A cool front entered the Panhandle on the 15th and moved downstate on the 16th and 17th. The skies dripped welcome rains and drizzle from the 16th to 19th. Additional moisture fell on the 22d and light to locally heavy showers occurred on the 24th. Although much of Texas received soaking rains--the first general rains since May 1956--a few stations in the western Panhandle received less than one-fourth inch and Bunker Hill received none. In general, most stations over the High Plains, Trans-Pecos, Edwards Plateau, and southern Texas (except the Lower Valley) received less than two inches. Heavier amounts fell over most other sections and a few scattered vicinities received more than five inches. The greatest monthly total, 6.72 inches, fell at Daingerfield. Most stations received between 50 percent and 150 percent of the long-term means. Scattered stations received several times their long-term means. For instance, Alpine received more than seven times the long-term average for that station. Many stations received more rain during February 1957 than during the preceding several months. Marathon received more rain during February 1957 than during the entire year of 1956.

Heavy rains revived crop and pasture prospects over much of Texas. Wet ground delayed field work from the Cap Rock and Pecos River eastward across the State but the jubilant farmers did not complain. They tuned their tractors to have them ready to roll as soon as the fields dried. The rains fell slowly with little runoff. Soil moisture built up in some areas where the early-season soil moisture became the best in several years. Cattle were removed from some fields which became too wet for grazing. Practically all of south Texas had planting moisture. In the Coastal Bend, sorghum was emerging and cotton planting got under way. Improved moisture caused some farmers to withdraw cotton acreage originally signed up under the Acreage Reserve Program. Penetrating rains continued to be needed to restore pre-drought levels, especially over the western half of Texas.

Green bugs caused some trouble in the small grain fields of some northern counties. Rust and mildew increased in central, southern, and southeastern oat fields. Corn along the Upper Coast came up to uniform stands. Many peach, pear, and plum trees were in full bloom and vulnerable to frost.

Scattered showers interrupted the harvest of winter type vegetables and the planting of additional spring crops in the Coastal Bend, Winter Garden, and the Lower Valley.

Not only were conditions favorable for growing crops in most areas of the State, but the February rains brought the most promising prospects for spring range and pasture feed in recent years. Small grains, rescue grass, and clovers came up rapidly over the east side of the State. Cattle and calves picked up rapidly on the increased supply of lush green feed. Native ranges and pastures over the west greened but were still short. Cattle in the west were maintained on supplemental roughage and concentrates. Ewes and lambs responded to the improved feed supplies over much of the important sheep country.

On the 16th, a small tornado broke several poles and demolished a garage in Cameron County.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent samples published in Table 7 are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

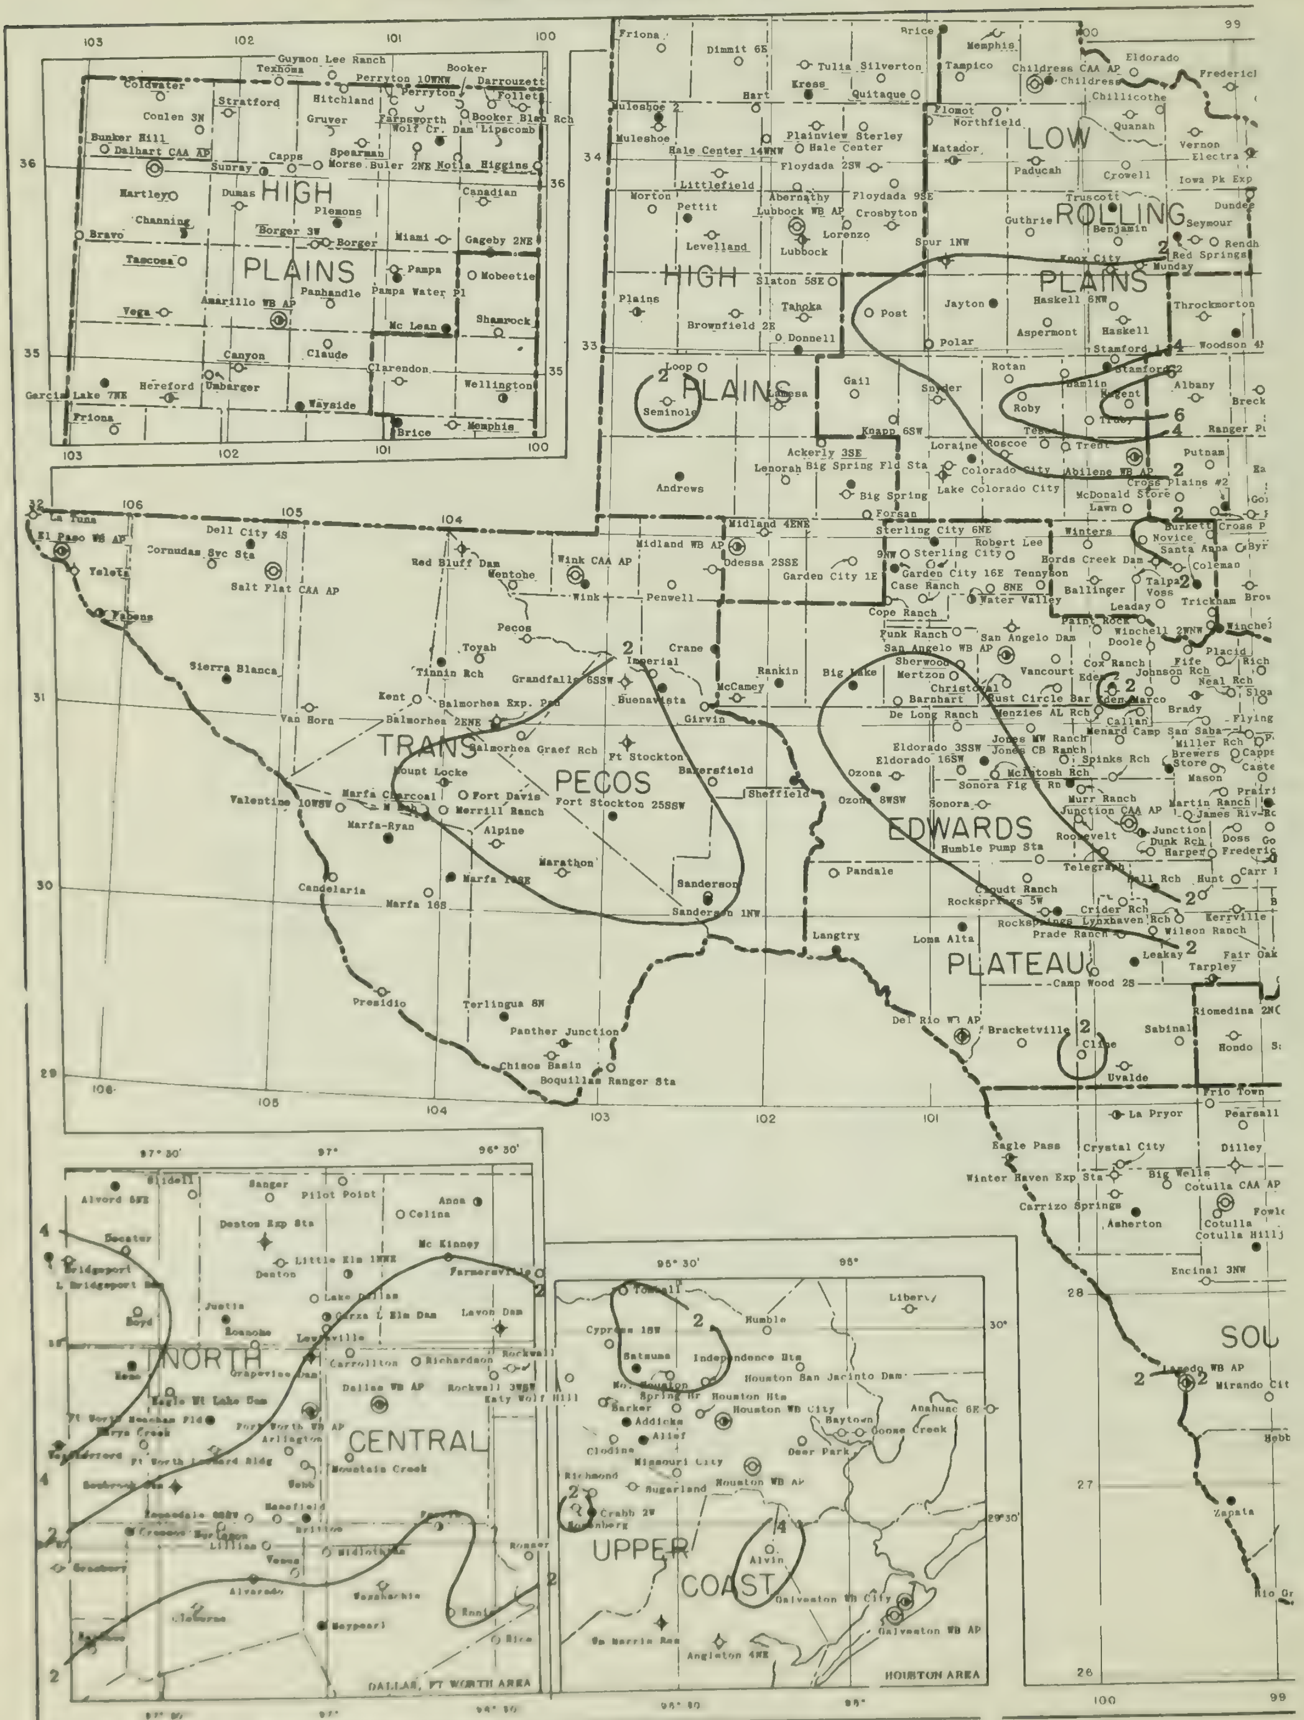
Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 4-8-57 -- 1650

TOTAL PRECIPITATION

FEBRUARY 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TEXAS - MARCH 1957

WEATHER SUMMARY

March was a month of violent weather. Sand storms and dust storms swept across the west. The most severe spring blizzard of record crossed the Panhandle. Cold winds brought snow flurries to the southern Plains. Freezing temperatures occurred as far south as Austin. Heavy rains, hail, severe thunderstorms, and tornadoes frequented the east. The rains delayed field work but brought encouragement to farmers and ranchers, many of whom believed the protracted drought had ended.

March "came in like a lamb". The weather was mostly mild and sunny. The few widely scattered showers were of little consequence. Near the end of the first week, a fresh "norther" moved into the Panhandle. It brought freezing temperatures to the High Plains, the eastern portion of the Trans-Pecos, all except the southern edge of the Edwards Plateau, and eastward to Port Arthur. Most stations registered their lowest temperatures for the month on the 7th or 8th. The coldest temperature for the State, 10 degrees, occurred at Miami and Spearman on the 7th. This "norther" did not bring cold temperatures to the extreme west and the upper Rio Grande area. The cold wave moved southward and dropped the minimums in the Lower Valley into the upper 30s and 40s. Mild sunny weather returned on the 9th. Gentle southerly winds brought the temperatures back into the high 70s and 80s before another "norther" pushed southward, kicking up dust storms and sand storms over west Texas and the Trans-Pecos and triggering thunderstorms with heavy rain and hail and scattered tornadoes over the central and eastern sections. Other northers followed. They blanketed the State with dust. Squall lines set off locally heavy thunderstorms from the Low Rolling Plains southeastward to the Gulf. Some stations along the Upper Coast received from four to six inches of rain on the 17th. Temperatures continued about seasonal. Tornadoes, hail, and heavy downpours occurred over central Texas on the 20th. Two days later strong, gusty winds covered the entire State with dust. That preceded the worst spring blizzard of record in the Texas Panhandle. The heavy snow kept falling until late on the 24th but continued to drift on the 25th. Freezing temperatures swept over the High Plains. Squall lines produced locally heavy showers and hail over the eastern two-thirds of the State during the last week of March. The heaviest rains occurred on the 27th, 28th, 30th, and 31st. A few widely scattered tornadoes occurred over central Texas as the fronts progressed across the State.

Several paradoxes summarize the March weather for Texas. The warmest day in the extreme west was the coldest day over the eastern two-thirds of the State. The highest temperature at El Paso, 80 degrees, occurred on the 8th. The highest temperature for the State, 97 degrees at Rio Grande City, occurred on the 22d while a blizzard raged over the northern High Plains. Six stations received no rain; at other stations, it was the wettest March of record. The soil moisture in the Lower Valley was good for the crops but irrigation water was in short supply.

Farm and ranch prospects brightened over much of Texas during March. Rain and snow replenished the topsoil moisture over the eastern half of the State and started the long process of rebuilding the subsoil reserves. Wet ground held field work at a standstill during much of the month. Mild open weather was needed for planting corn, cotton, rice, and sorghum. Alfalfa and clover made lush growth and good yields of early hay were assured. Surplus supplies of rescue grass, clover, and small grain were available and cattle and calves were becoming sleek and fat. To the west, the grass was green but short. Supplemental feeding eased in the Low Plains and southward but continued in the High Plains where more rains were needed to bring on summer pastures. Ewes and lambs fattened on the cool-season grasses and weeds in the east and responded to the increased green feed on much of the Plateau. Green feed on the western Plateau continued short and more rain and warm weather were needed in that area to bring on spring grazing. Winds up to 80 miles per hour whipped up snow and dust and reduced the visibility to near zero from the afternoon of the 23d to the morning of the 25th. Cattle losses were especially heavy in Dallam and Sherman Counties. Freezing temperatures caused light damage to fruit crops except in a few local areas. Rains interrupted field work in the important vegetable producing areas. Cool weather retarded the early crops of cantaloupes and tomatoes in the Lower Valley. Potato land in the High Plains was ready for planting. Seed was on hand but little acreage was planted.

STORMS

March 3: At 12:15 p.m. three-fourths-inch hail fell at Gardendale, six miles north of Cotulla. Hail, hen-egg-size, damaged roofs, broke window panes, dented cars and smashed windshields at Fowlerton. The storm ended about 1:15 p.m. At Beeville, pecan-size hail fell between 2:30 and 2:45 p.m. One-inch hail fell at Corpus Christi between 3:00 and 5:00 p.m. About 7:30 p.m. a ten-minute hailstorm centered over Premont. It damaged roofs and broke windows.

March:6: Between 5:30 and 6:00 p.m. one-inch hailstones damaged grounded aircraft at Refugio. Wind gusts reached 44 miles per hour. One and one-half inches of rain fell in 15 minutes.

Three funnel clouds, none touching the ground, were reported 25 miles north-northeast of Corpus Christi between 6:00 and 6:30 p.m.

March 11: Squall line winds during the early morning damaged television aerials and twisted signs along a three-mile path starting about one mile south of Temple. As the storm moved southeastward, strong winds at Cameron at 2:10 a.m. blew down trees. Hailstorms with stones up to two and one-fourth inches in diameter peppered Brooks Field and parts of San Antonio during the afternoon. The storm ended about 6:00 p.m. As turbulence continued, hail up to one inch in diameter fell at Austin from 6:57 to 7:12 p.m. damaging roofs, windows, neon signs, and aircraft. About 9:00 p.m. a tornado occurred west of Zunkerville, but hit in open country. No damage was reported.

March 12: Thunderstorm winds in the Lower Rio Grande Valley demolished a small metal barn about 3:00 a.m. and rocked a tenant house in the Brownsville area. At Harlingen between 3:30 and 4:30 a.m. wind broke tree limbs, stripped leaves, and overturned a small house. During the early afternoon six funnel clouds were sighted in the Victoria vicinity. None touched the ground.

Twisters occurred at Port Bolivar where two houses were blown off their foundations; another was destroyed and several were damaged. Winds reached 75 to 80 miles per hour and heavy rain and some hail fell along the upper coast. The rain and hail were accompanied by high winds. Several small twisters were seen. Texas City received 9.23 inches in a six-hour period. Widespread flooding resulted from this torrential downpour. Houston measured five inches during the same period. A small tornado accompanied by heavy rain occurred at 5:50 p.m. near Jefferson County Airport. Damage was slight. One person was killed and seven injured. At nearby Arcadia, what was believed to be a tornado damaged at least 12 houses and barns. A wing of a church under construction was picked up, spun around, and demolished.

March 20: Strong winds associated with hailstorms and thunderstorms damaged some power and telephone lines east of Crane in the forenoon. Tornado funnels were seen five miles northeast of Seminole at 11:30 a.m., 10 miles west of Big Spring at 12:45 p.m., 20 miles northeast of Midland at 12:50 p.m., and 40 miles east-southeast of Abilene at 2:35 p.m. None of the funnels were seen to touch the ground. One-inch hail fell near Bronte, about 50 miles southwest of Abilene, during the early afternoon. A severe thunderstorm accompanied by high winds, hail, and heavy rain occurred southwest of Gatesville. A tornado funnel touched the open ground about 15 miles north of Beeville in the early evening but caused no damage.

Hail of one to two inches in diameter fell for about 0 minutes over Del Rio, broke tree limbs, and caused minor damage to roofs. Heavy rain accompanied the hail. High winds and hail damaged a number of roofs at Kerrville in the afternoon. In the early evening hailstones up to three inches in diameter damaged roofs, broke windows and ripped siding from some ouses in the southeastern part of Austin. The downpour accompanying the storm flooded downtown stores. Approximately 25,000 windows were broken at Bergstrom Air Force Base. Aircraft parked in the open received some damage. Between 7:10 and 7:30 p.m., a tornado accompanied by hail destroyed a church and damaged roofs at Lincoln, Loebau, Mahaw, and Giddings. A funnel cloud passed aloft over Dime Box. It touched the surface at the Beat Five area about four or five miles southeast of Dime Box, injuring two persons.

Winds were estimated to 80 miles per hour. Hail covered the ground to a depth of 6 to 12 inches. A three-inch rain fell in 20 minutes at Lincoln. igh winds and hail caused crop and livestock losses and damaged roofs in the Somerville, Navasota, and renham vicinities.

March 22: Strong winds with gusts to 63 miles per hour occurred at El Paso. Blowing sand reduced the visibility to one-half mile at the airport. The sand scored trees and paint.

March 22-25: A cold front moved into the Panhandle accompanied by winds up to 80 miles per hour and snow. Citizens could not recall a worse spring blizzard. The storm caused heavy livestock losses, especially in the northernmost counties. The blizzard halted all transportation and isolated some communities. Many telephone lines were out of service. Some drifts were 30 feet deep. More than 4,000 persons were marooned. Ten persons died.

March 27: Severe thunderstorms began at 5:02 p.m. at Waco. Gusts reached 70 miles per hour. Heavy rain and hail did extensive damage to roofs, windows, and windshields in the city.

March 31: During the early forenoon a tornado uprooted trees, tore roofs from barns and sheds, and damaged telephone lines and television antennas two miles northwest of Boerne.

About 9:05 a.m. a tornado occurred over a path 300 feet wide and six blocks long in the north edge of Austin. The storm moved north-northeast. High winds accompanied by heavy rain struck Georgetown between 9:30 and 10:00 a.m. Trees and power and telephone lines were blown down and roofs were damaged. At 10:30 a.m. a tornado tore a 40-foot gap in the wall of a brick school at Pflugerville. High winds damaged roofs, twisted a large highway sign, and unroofed a barn at Taylor. Lightning struck an oil tank farm 10 miles west of Goliad, setting three tanks on fire and destroying the contents. About 1:30 p.m. a small tornado struck 11 miles north of Palacios, tearing off roofs and uprooting trees. At Huntsville between 12:30 and 12:40 p.m. high winds did heavy property damage and injured two persons. At Baytown a small twister damaged at least three houses and knocked down a 295-foot radio tower. Funnel clouds were reported near Normangee between 11:58 a.m. and 12:08 p.m. but none touched the ground. Another funnel cloud, not touching the ground, was reported in the vicinity of College Station at 4:25 p.m. From 9:15 to 9:30 p.m. at McNeil, a tornado knocked over a windmill and damaged chicken houses and sheds. Lightning destroyed three oil tanks 10 miles west of Goliad.

See reference notes following Station Index.

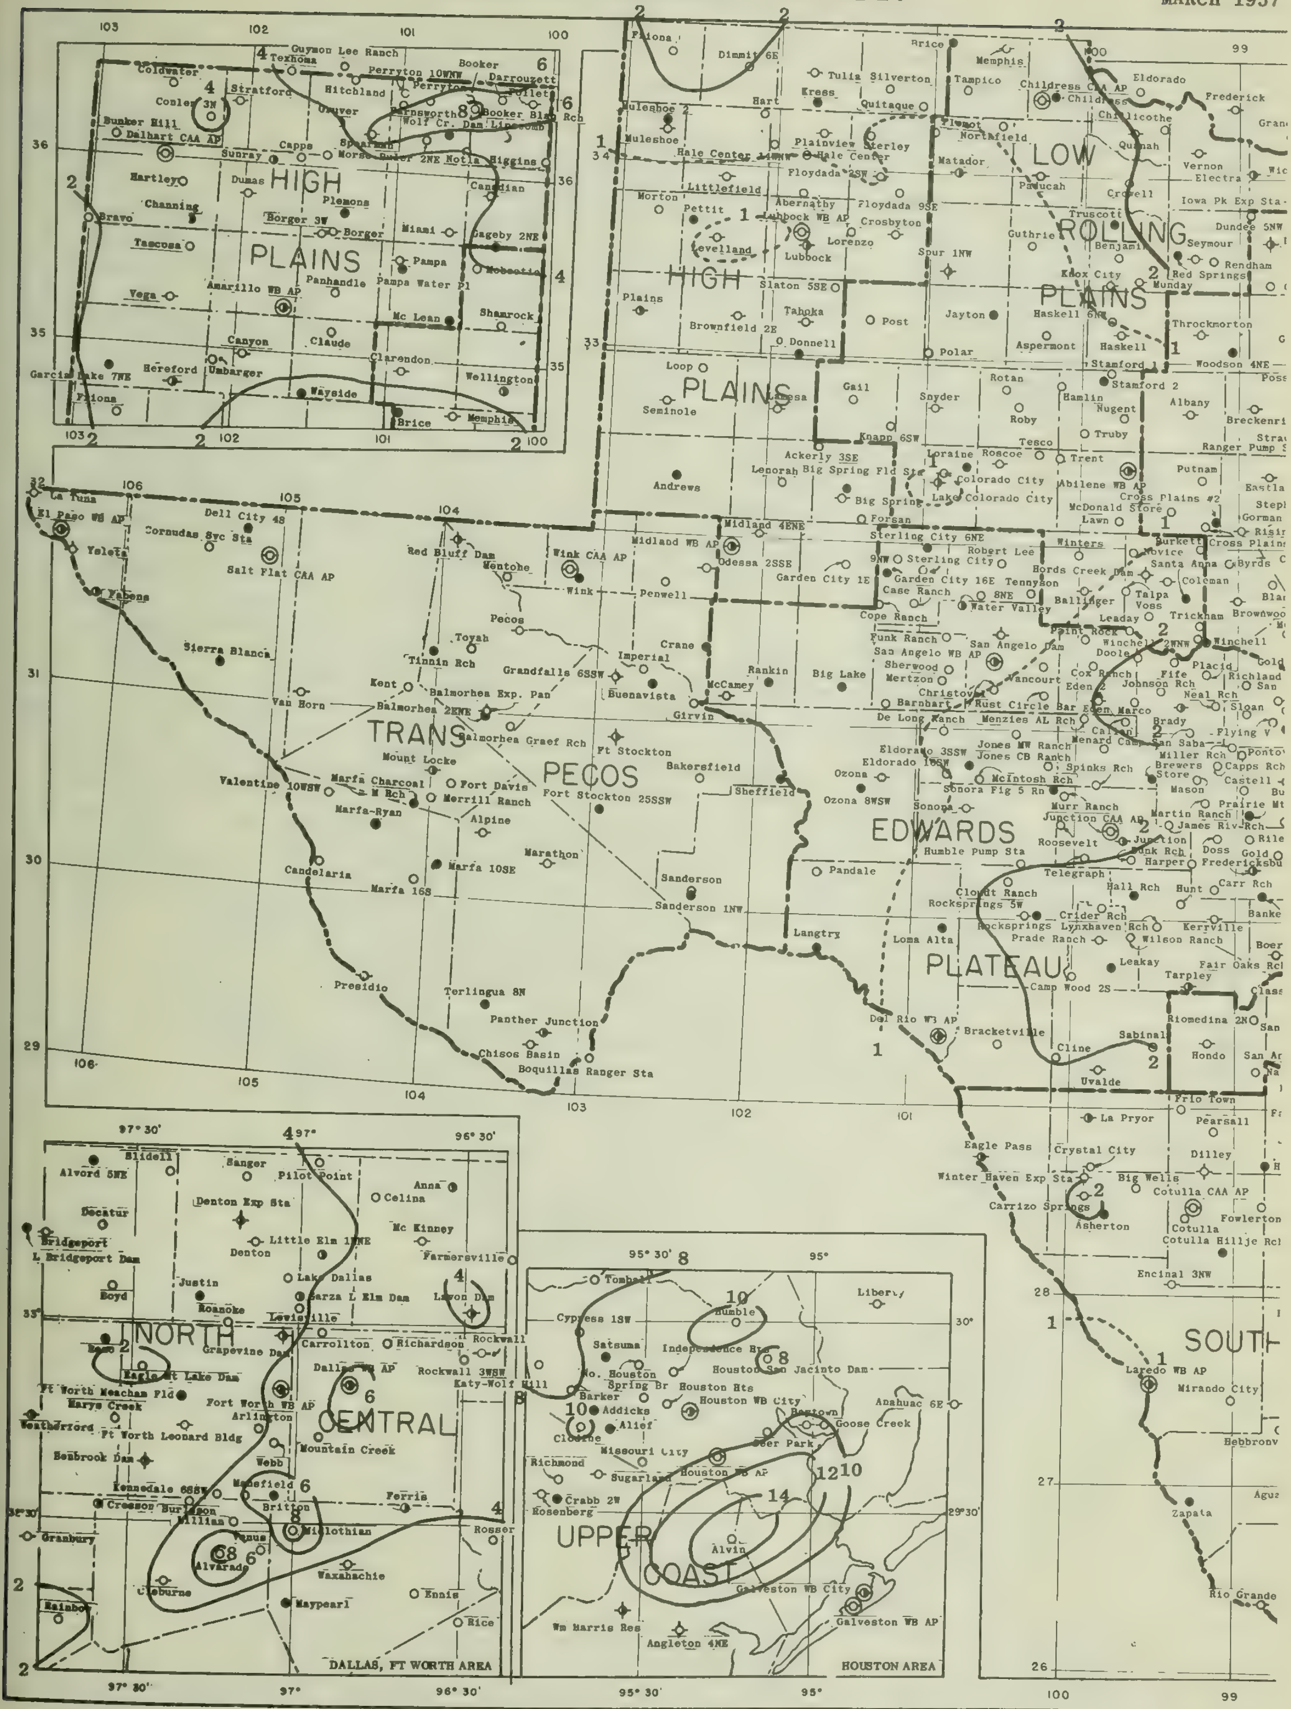
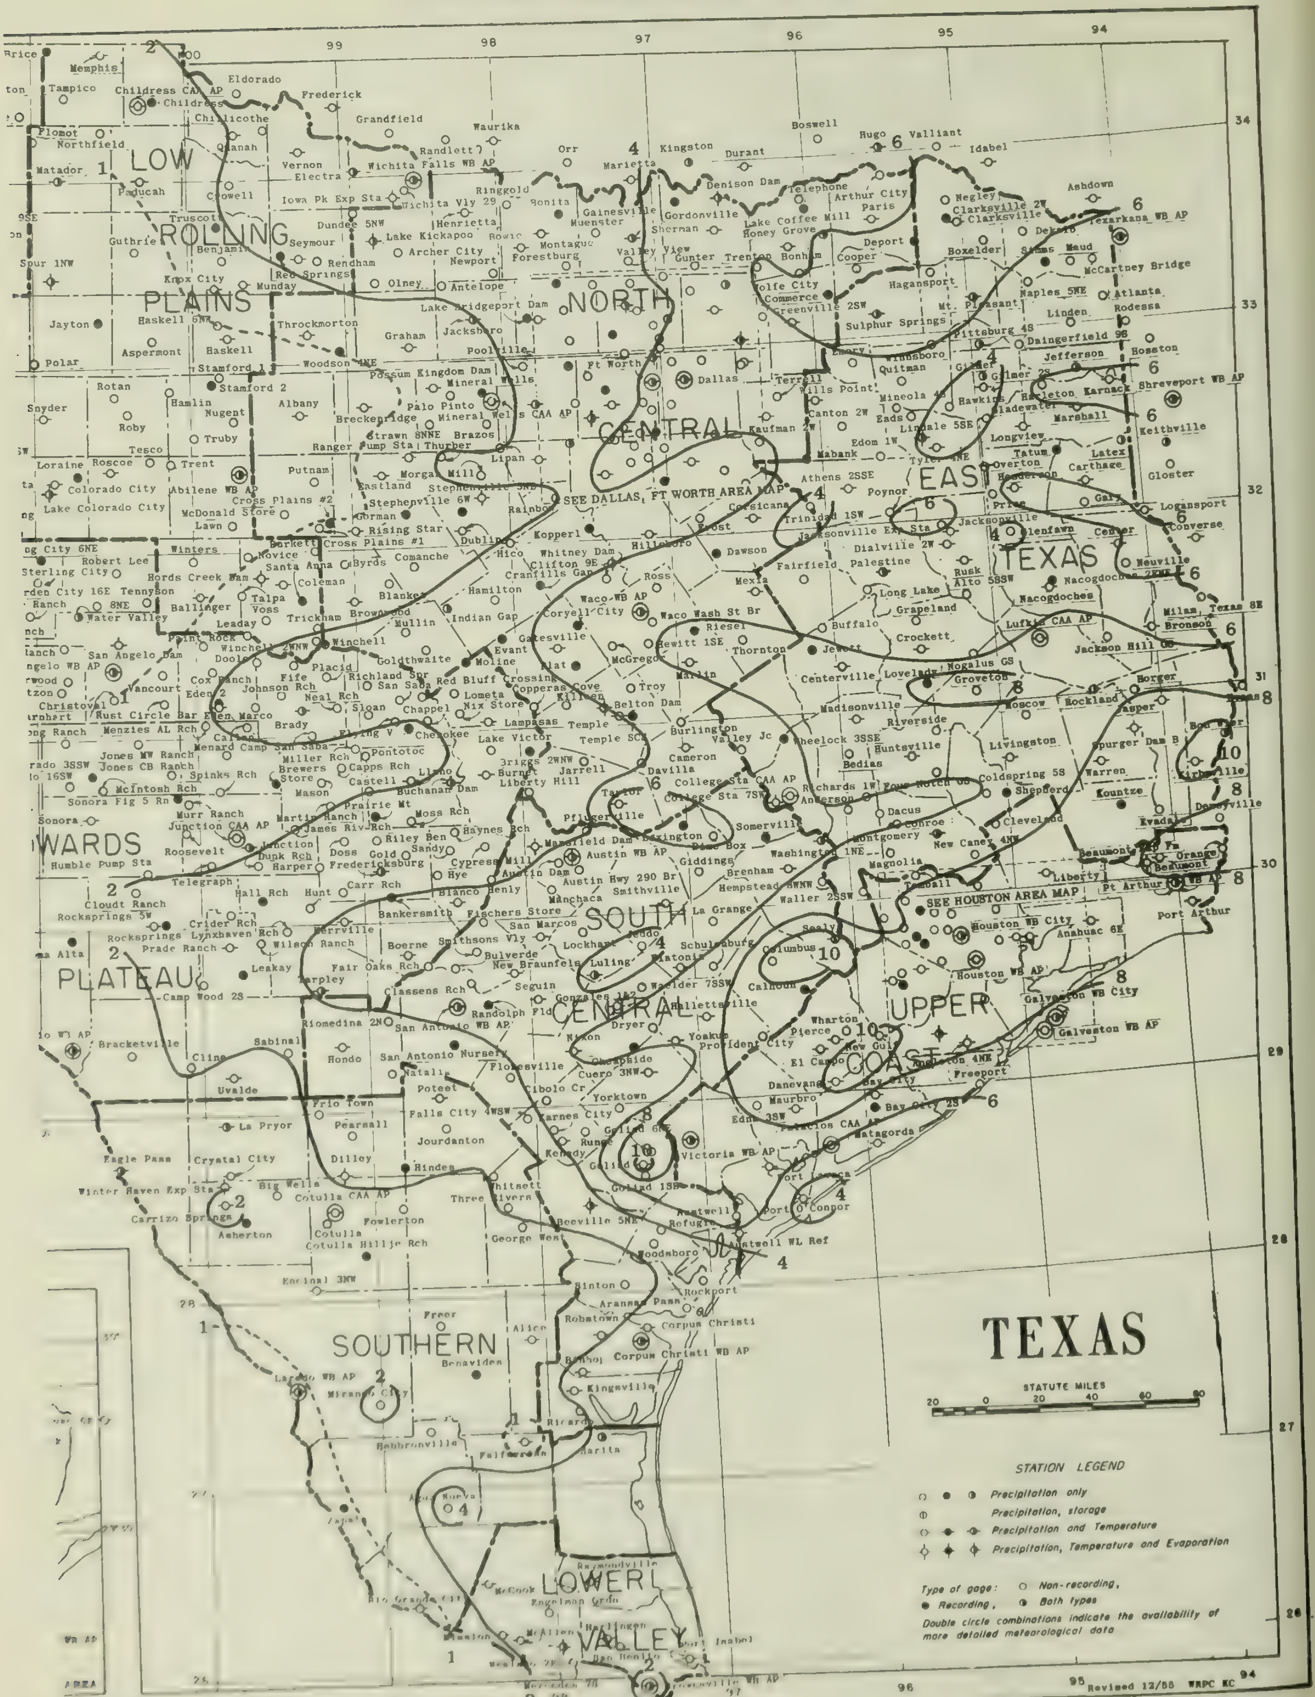
TOTAL PRECIPITATION

MARCH 1957



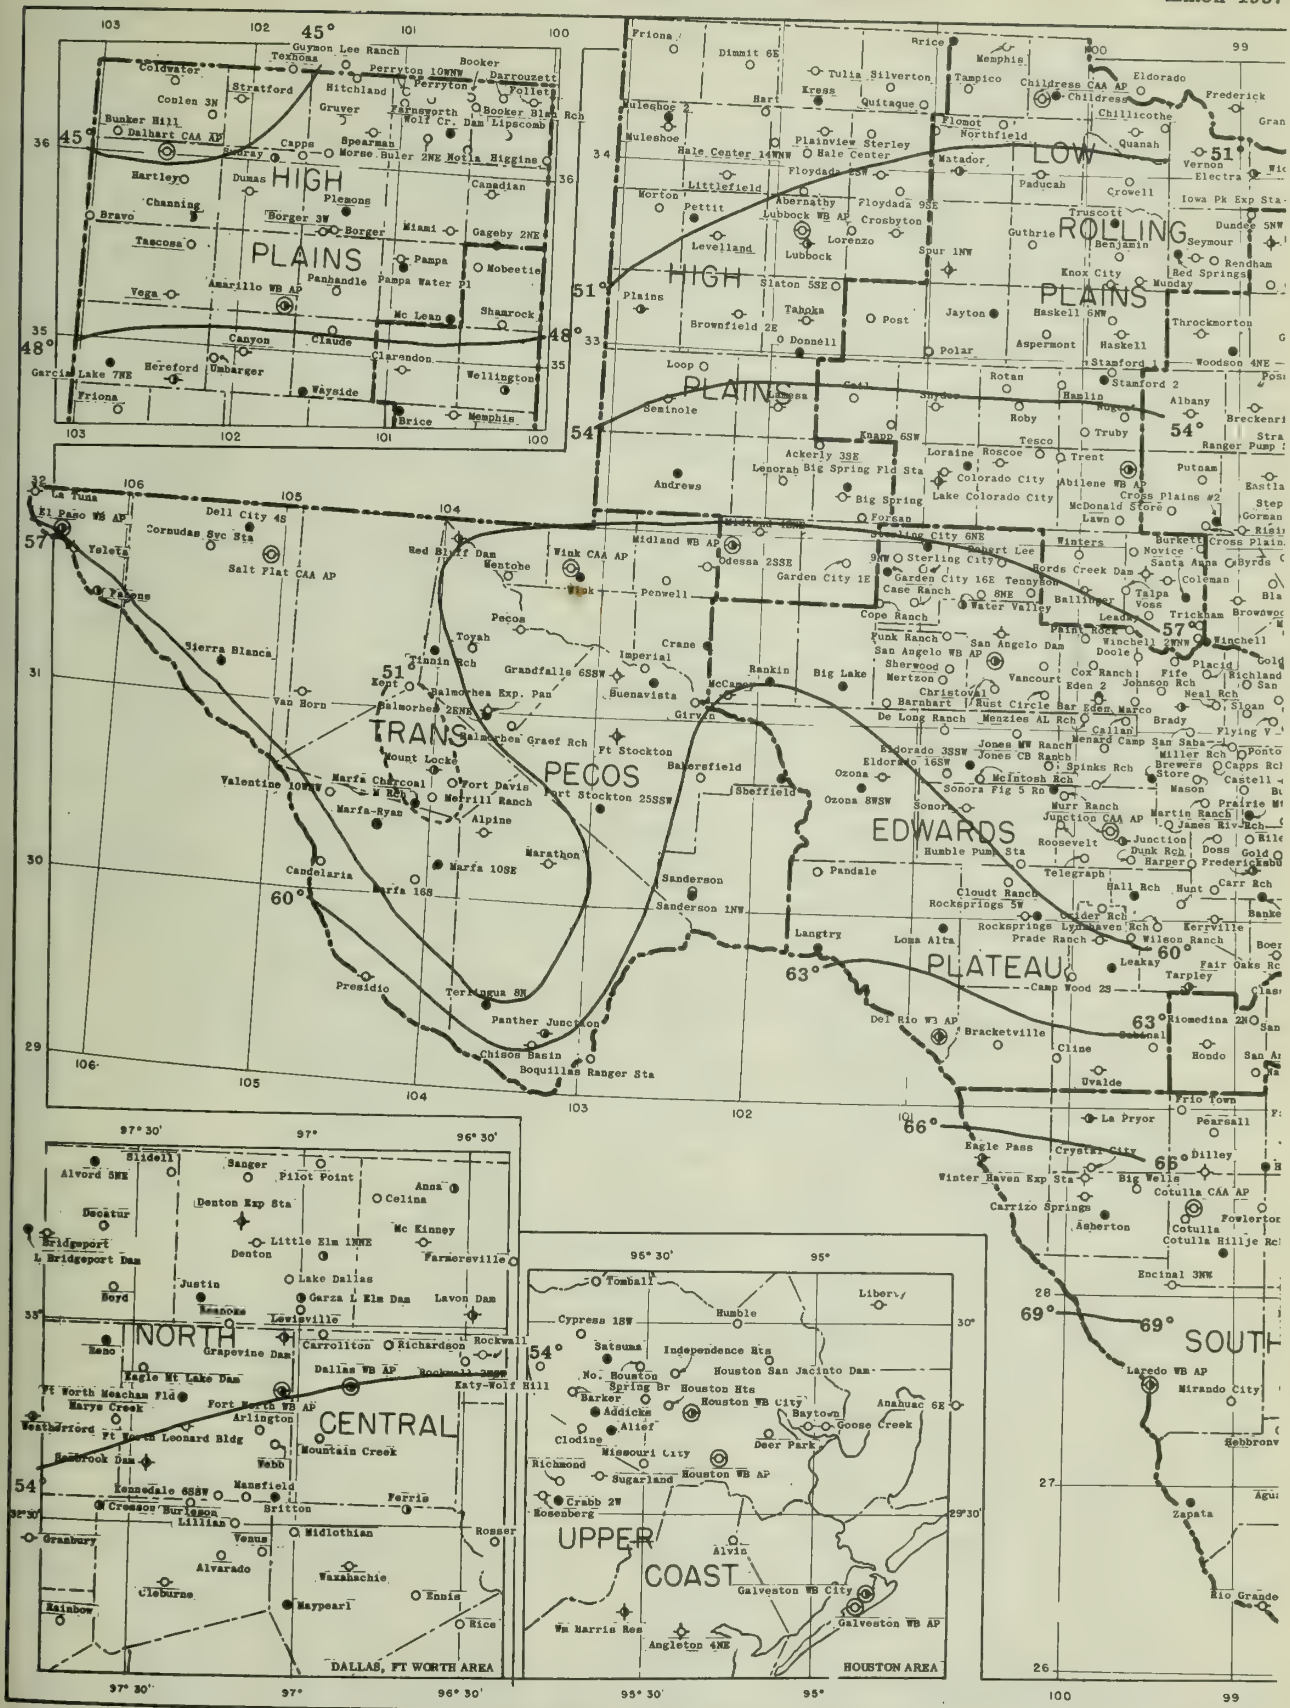
Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

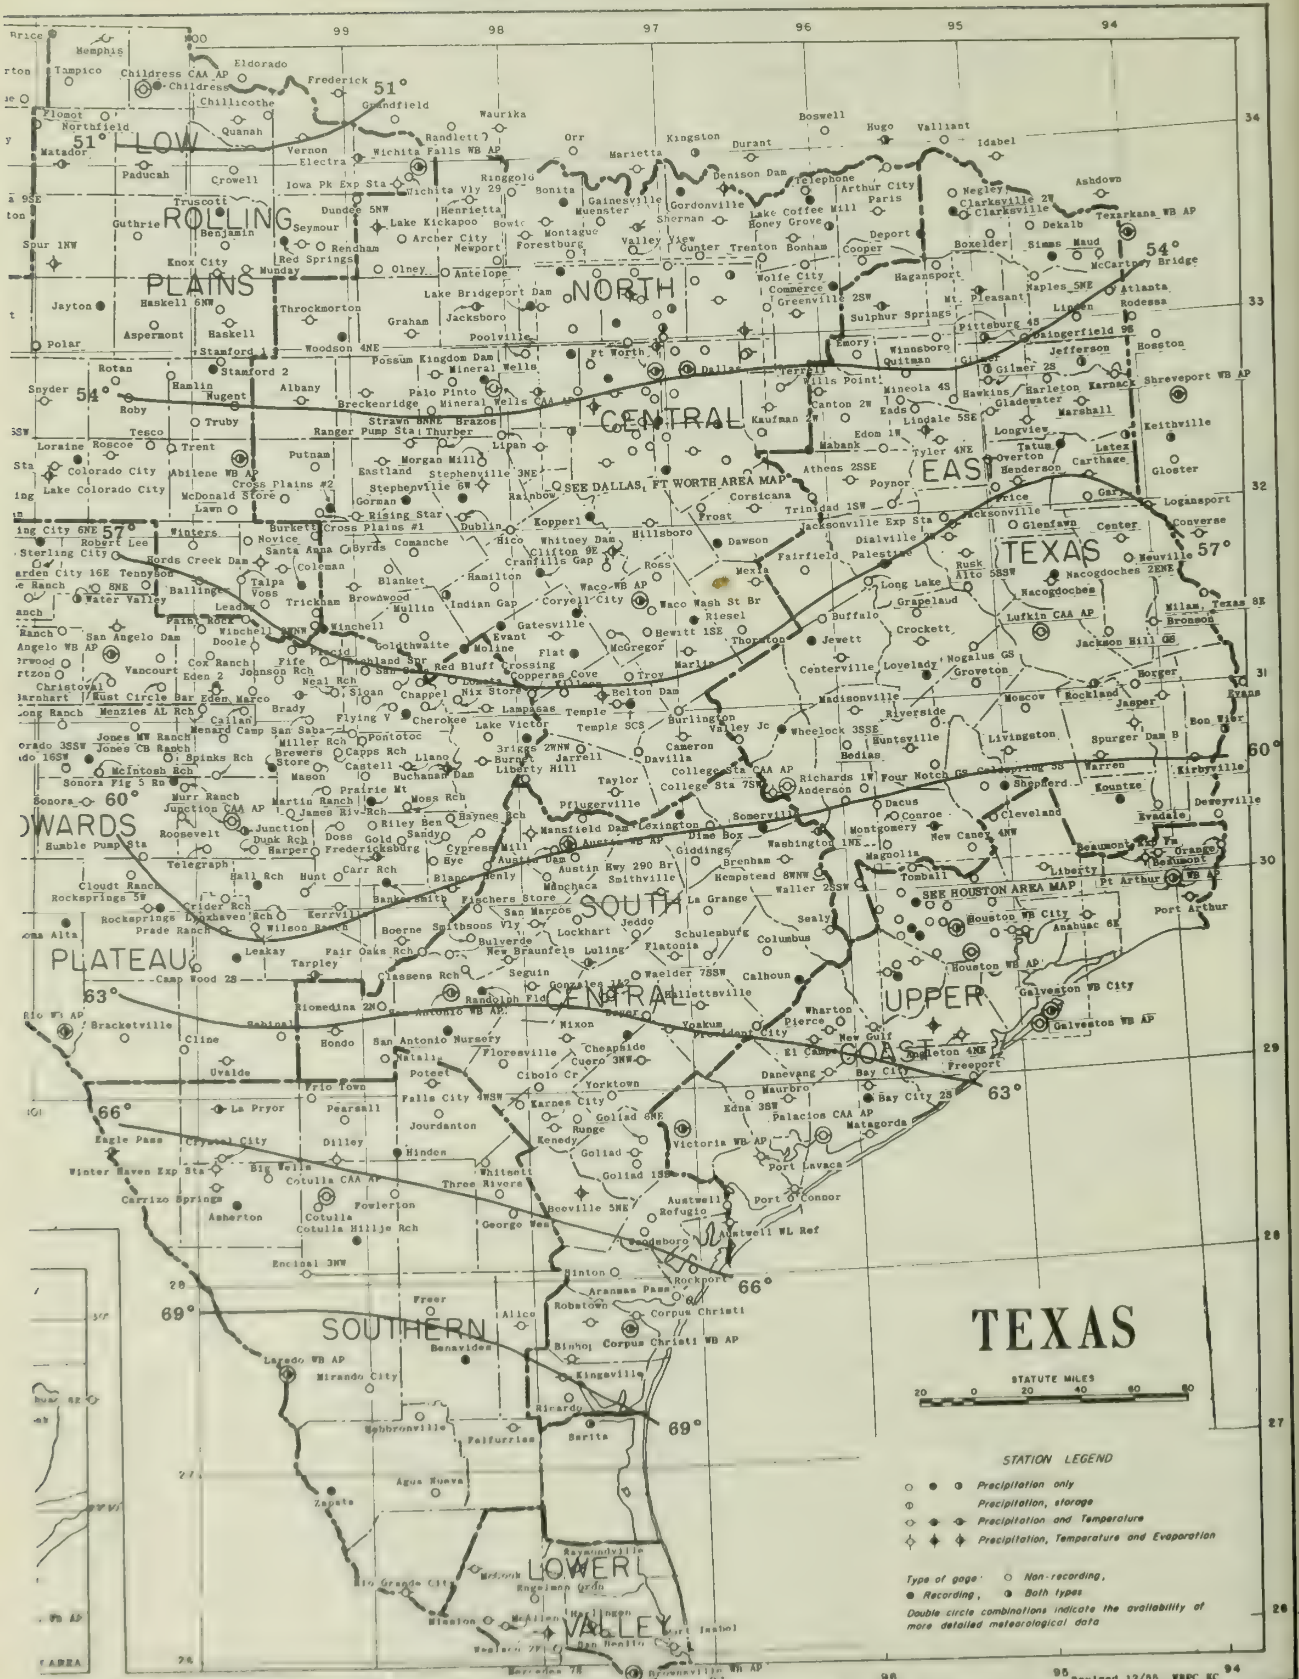
AVERAGE TEMPERATURE



Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

MARCH 1957



Isolines are drawn through points of approximately equal values.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

ASHEVILLE: 1957

WEATHER SUMMARY

April was a month of contrasts. The drought which had plagued the extreme west for eight years continued. The east was "gored by the horn of plenty!" Day after day, the State was lashed by tornadoes and battered by hail. Nine rivers were in flood. Thousands of acres of crops were washed out. Before that - several days of rain. Before that - the Dallas tornado. More than 60 damaging storms, including tornadoes, occurred during April. Everything from Amarillo-Lubbock-San Angelo-Laredo-Brownsville and eastward was wet in variable degree, from damp to deluge. Many cities had a comfortable excess. Monthly precipitation totals ranged from none at Valentine 10WSW to 20.48 inches at Glenfawn. Temperatures over most of the State averaged below seasonal.

From warm and humid over the entire State early in the month, Texas weather in a few days ran the gamut of windstorms, thunderstorms, hail, and tornadoes across central sections and dust in the Panhandle and the west. The first week finished with freezing temperatures over the Panhandle and cool weather over the rest of the State. A norther moved downstate on the 11th and 12th bringing snow, sleet, and freezing rain to the Panhandle and northern counties. Isolated thundershowers preceded the front. Freezing temperatures advanced southward to Stockton, Brady, Corsicana, and Paris. Warm moist air covered the State shortly after the middle of April. Instability squalls triggered tornadoes and hail storms almost daily beginning the 18th. Torrential downpours flooded streams locally and closed low-water bridges and highways. Some of the thunderstorms produced six inches or more of rain. Rain fell in all parts of the State except the Trans-Pecos. Turbulent weather continued through the rest of the month. Tornadoes, hail, and cloudbursts dumped heavy precipitation over the entire State except the High Plains, the Trans-Pecos, and south Texas. The heavy rains flooded all streams from Dallas southward.

Rains and more rains--from slow soakers to old-fashioned gully washers--covered the State except the Trans-Pecos. The rainy weather and muddy fields delayed farm work. Some crops were flooded or washed out. By the end of April most areas had received enough rain and fair weather was needed to get seed into the ground.

Wheat and other small grains made rank growth. Wheat improved in the northern High Plains. Good yields were in prospect in the east. The two main hazards were lodging and rust. Rank-growing wheat in the Blacklands was heading. In the Blacklands and the central counties, waist-high oats were in the milk stage. At the beginning of April, corn in the Lower Valley was in all stages of development, from just emerging to tasseling. Along the Upper Coast, the corn plants were about eight inches high. Corn planting advanced over the eastern half of the State until stopped near the end of the second week by a cold norther. At the end of the month, corn planting lagged seriously in the areas north of Temple and Lufkin. Many fields required replanting because of poor germination and washing rains. Much of the corn had a yellowish color and needed warm sunny weather. Sorghum planting also lagged in those wet areas but sorghum could safely be planted later than corn. Sorghum in the Coastal Bend was cultivated for the last time and that in the Lower Valley was heading.

Cotton was slow in the Lower Valley. By the middle of April, cotton planting had started in the Trans-Pecos and in the south central counties but warm weather was needed to permit the farmers to catch up on land preparation, planting, replanting, and cultivating. At the end of the month, growers in the east still waited for the ground to dry to finish planting. Waterlogged fields delayed rice planting. Some fields were seeded by airplane. Alfalfa was ready for cutting the first time but fair weather was needed for curing the hay. An excellent flax crop was ready for harvest in Kearnes County. Pecans bloomed in the south central and southeastern counties and peaches set a heavy crop.

Cool rainy weather hurt the earliest vegetable crops in the Lower Valley. The spring crop vegetables in the later areas were set back by the cool weather but were in generally good condition.

At the beginning of the month, a few farmers and ranchers in the northern High Plains were still looking for cattle which strayed in the late March blizzard. The surviving animals required heavy supplemental feeding until the rains came in the latter part of April. Supplemental feeding then tapered off. Over the eastern side of the State, cattle and calve gained weight on the abundant green feed an the demand for stocker cows, yearlings, an calves continued strong. The Trans-Pecos remained dry and heavy supplemental feeding continued in that area.

Floods in eastern and central Texas claime several lives, destroyed hundreds of homes forced thousands of families to leave the low lands, and caused millions of dollars of damage. For details concerning the widesprea flooding that occurred in April, the reade is referred to Climatological Data, Nationa Summary.

Lucius W. Dye
Climatologist
Weather Records Processing Cente
Kansas City, Missouri

combination of tornadoes, hail, and damag-
ng thundersqualls prevailed most of the month
ı Texas. A total of 65 separate tornadoes have
een recorded, which killed 11 people and in-
ured 248, and caused property damage estimated
ı the millions. Major losses occurred at Dal-
as on the 2d, in the area just west and north-
est of Lubbock on the 21st, to the east of
ıstin around Elgin and Rockdale on the 24th,
ıd at Tyler on the 26th.

ı addition to the Dallas tornado of April 2, 12
:hér tornadoes caused damage in counties to the
ırth of Fort Worth and Dallas, which included
ınton, Collin, Grayson, Cooke, Montague, Hop-
ns, Delta, and Lamar Counties. One small tor-
ıdo occurred in Hale County in the High Plains
ı this date. The Dallas tornado struck the
ıstern portion of the city during the period
30-5:10 p.m. The storm moved just to the west
Love Field Airport and then lifted. It was
:companied by heavy rain and a loud roaring
ise. Some 574 buildings were damaged or de-
royed, electrical service interrupted in 75,000
mes, and 4,000 telephones were put out of com-
ssion. Ten persons were killed, 200 injured,
d damage estimated at several million dollars.

the next day the tornado pattern moved some-
at to the east and a number of small tornadoes
curred in northeast Texas, mostly in Shelby,
rrison, and Morris Counties. There were no
juries or deaths on April 3. In an electri-
l storm in the Ratibor community near Temple
e person was killed by lightning on the 4th,
d near Gilmer one person was killed by light-
ıg on the 15th.

new tornado situation developed on the 18th
d this upper wind tornado-forming flow pat-
rn persisted almost daily until the 26th. A
ıber of serious storms occurred on the 21st
l 22d in the High Plains of west Texas, from
dland County to Briscoe and Hall Counties,
st of which were west of the Caprock. In the
yelland-Amherst-Littlefield-Shallowater sec-
ın to the west and northwest of Lubbock, sev-
ıl tornadoes injured 36 people and caused extensive property damage, but no deaths, during the late afternoon and night of the 21st. A number of small tornadoes also occurred on the 22d in this same general area, but with no major damage and no injuries.

Quite a number of severe storms and tornadoes formed on the 24th from the central Texas area around Austin, northeast to Texarkana. One man was killed at Dallas by lightning and two persons were injured near Elgin in Bastrop County by a tornado. The tornado that formed east of Austin near Webberville moved into the Elgin area causing damage near Elgin. A brief tornado also dipped at the airport at Rockdale, Texas, destroying a hangar and damaging two airplanes. Lightning damaged an oil pipeline tank at Corsicana.

On the 26th a new outbreak of tornadoes occurred in the Coastal Plains and in northeast Texas around Tyler, and in the counties of Gregg, Harrison, and Sulphur. There was major damage at Tyler,by a tornado that struck at eight o'clock in the morning, which damaged some 400 homes, three schools and one church. Six were injured, but no deaths, and damage was estimated at more than a million dollars. Around 9:30 in the morning, to the east and south of Longview and in the Gilmer area, other small tornadoes caused damage. No one was injured.

Numerous funnels aloft were reported by the public all month and blustery winds with thundersqualls caused some additional minor losses. Hail in connection with heavy thunderstorms caused isolated damage over most of the State during the month, injuring local crops and damaging some buildings. A major hailstorm occurred at Stamford in Jones County the evening of April 11.

REFERENCE NOTES

dditional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, ustin 2, Texas, or to any Weather Bureau Office near you.

igures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

onthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

tations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

ivisions, as used in Table 2 and on the maps, became effective with data for October 1956.

nless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. onthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

vaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

ong-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent ob- ervations taken at the present location.

ater equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from dif- erent points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsisten- ies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snow- all in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

ata in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times local standard time. During the summer months some observers take the observations on daylight saving time.

now on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

bscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, vernment Printing Office, Washington 25, D. C.

formation concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation tory" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Simi- information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price cents.

ASHEVILLE: 1957

WEATHER SUMMARY

There were a few mild, sunny days during May but most days were cloudy and rainy. Temperatures averaged lower than usual. The frequent rains delayed field work seriously. Ranges and pastures grew rank but corn fields became weedy.

Torrential downpours fell over much of Texas during May. The few mild sunny days were a welcome relief from successive days of heavy showers and thunderstorms. On several days during the second week of May, heavy rains fell over the Low Rolling Plains, Cross Timbers, Blacklands, and the Edwards Plateau with three to five-inch amounts from Abilene to Del Rio. Excessive rains fell in the Red River Valley on the 17th. Four-inch amounts were common in the Wichita Falls area on that date. During the last week of May, heavy rains fell over most of the State except in the extreme south, west of the Pecos, and portions of the Panhandle and the High Plains.

Rainfall was heaviest over the Cross Timbers, Blacklands, and the eastern counties of the Edwards Plateau. Most stations in those areas received six inches or more of rain during May. Several stations received more than 12 inches. The greatest monthly total, 19.32 inches, fell at Brazos. Although heavy rains fell over most of the State, there were wide areas where the precipitation totals were considerably less than the long-term means. A few stations along the Upper Coast and several stations in the extreme western portion of Texas received less than an inch of rain during May. Several western stations received less than one-fourth inch. The least monthly total, 0.07 inch, fell at Fabens and at Ysleta. So the May rainfall ranged rather widely. It was the wettest May of record at Del Rio, San Angelo, Abilene, Wichita Falls, Fort Worth, and Dallas and the driest May of record at the Jefferson County Airport at Beaumont. The five-month totals for January through May 1957 at Dallas, Del Rio, and Abilene were greater than the long-term annual averages but the Midland-Odessa area received less than the long-term means during the three-month period, March through May 1957.

With much cloudiness and very little sunshine, the temperatures averaged lower than usual at most stations. Monthly mean temperatures ranged from 58.0 degrees at Vega to 81.8 degrees at Rio Grande City. The absolute temperature range was from 36 degrees at Miami on the 5th and at Vega on the 8th to 110 degrees at Rio Grande City on the 22d.

Spring planting dragged seriously as torrential rains and turbulent weather continued over most of the State. Farmers tried desperately to get seed into the ground. They worked the drier spots between rains. Considerable cotton was planted on the southern High Plains during the second week and farmers in the southeastern fourth of the State were able to work on almost every day during the last week. In that area cotton, sorghum, and rice planting was well along and good progress was being made in cleaning the crops.

Wheat prospects in the High Plains continued promising. Most of the area received beneficial rains in the third week of May. By the end of the month, the irrigated fields and the fall germinated dryland fields were heading. The plants which germinated in February were in the boot stage. Eastward through the Cross Timbers and Blacklands, small grains stood in water part of the time. The excessive rains hurt the small grain crops. Heads did not fill as expected. Considerable acreage was on the ground because of rust, strong winds, and too much rain. South Texas flax harvest got underway early in May as the fields dried. In the south central counties, a considerable amount of oats was cut for hay when the farmers could get into the fields. Much of the oat acreage became too ripe for good quality hay and combines were brought into the fields to harvest the crop for grain. They were set low to save as much grain as possible. Yields were below expectations. Alfalfa baling got underway in the El Paso Valley. The first crop of alfalfa was ready for cutting in north Texas and the Low Rolling Plains but the farmers waited for open weather.

Time ran out for planting corn over the eastern half of the State and much of the intended acreage was planted to sorghum. Corn in the south central counties responded to cultivation where the fields dried enough so the farmers could get into them. Weeds and grass thrived where the farmers could not get into the fields. The sharply reduced acreage urgently needed sunny weather. Cotton in the Lower Valley and Coastal Bend fruited heavily but dryland cotton in the Valley was beginning to need water. Much cotton acreage was planted in the southern Blacklands and in the southeast and planting was being rushed in the northeast but wet fields delayed planting in the northern Blacklands northwestward to the High Plains.

Considerable cotton was planted in the western countie
of the High Plains. Early sorghums in the Lower Valle
were maturing and the fields in the Coastal Bend wer
heading. The corn and sorghums in the central countie
made excellent growth. Much sorghum acreage in the Black-
lands remained to be planted and very little of the in-
tended acreage in northern Texas and in the Plains ha
been seeded. The first cutting of alfalfa was cut in th
west and northwest. Only a small acreage of peanuts wa
planted. Rice seeding made good progress.

Vegetable areas outside the Lower Valley, High Plains, an
Trans-Pecos were plagued by too much rain and prospect
declined. Considerable acreage of north Texas onions wa
damaged beyond all hope of salvage. A light harvest o
watermelons started in several south Texas areas but th
crop was 10 days to two weeks late in most areas. Coo
weather slowed the development of onions and potatoes
the Panhandle but good yields were in prospect.

Range and pasture feed responded to the abundant rain
over most of the State except in the Trans-Pecos. Mos
pastures were weedy, however. Cattle and calves were ger
erally in good flesh. Ewes and lambs were also in goo
condition.

FLOODS

Floods occurred over most of the eastern two-thirds of t
State. Most streams in the Ft. Worth River District we
in flood stage at the beginning of May and with hea
rains at intervals throughout the month, the high stag
persisted. Many rivers in the San Antonio River Distri
flooded during May. The high waters claimed the lives
five persons in the District. Torrential rains on May
caused serious flooding and major losses along the Sou
Concho. Twenty-nine houses at Christoval were damaged
destroyed and 83 houses and furnishings at San Angelo we
damaged. Frequent heavy rains over the watersheds of t
Devils River, the Lower Pecos River, and the Rio Gran
set off rises that caused flooding at Del Rio and Eag
Pass. The flooding was confined to small pasture-la
areas and the damage was not important. Heavy local rai
over the Devils River watershed caused thousands of do
lars damage to roads, railways, and fences. Frequent hea
rains and flash floods caused considerable soil erosi
and minor damage to roads in the Upper Nueces and Fr
watersheds. The benefits of the rains were expected
offset the minor damage.

Kansas City, Missouri

STORMS

Tornadoes and severe thundersqualls during May killed
persons and injured 98. Thirty-three tornadoes were not
The major losses occurred on the 15th in Donley and Br
coe Counties. They included the Silverton disaster.
Silverton 25 dwellings, four granaries, a cotton g
petroleum warehouse, and other buildings were destroy
The tornado first touched the ground at Lockney, 13 mi
southwest of Silverton. The next major loss occurred
the 24th in several counties near Lubbock, where numer
tornadoes occurred. Another major loss occurred in
Wink-Monahans section of west Texas on the 30th when h
winds associated with a thundersquall damaged dwelli
public buildings, and business establishments. A
gust of 98 miles per hour occurred at the Wink Airp

Other tornadoes occurred with relatively minor damag
the following counties: Taylor (May 8th), Hartley (11
Harrison (13th), Briscoe (14th), Roberts (16th), Cr
(17th), Hill and Ellis (22d), Titus (23d), and Hood
Lampasas (25th).

Two persons were killed at Dallas by lightning on
31st and another in Hamilton County on the 13th.

Hail damage was confined to isolated areas but major
losses occurred in Hudspeth and El Paso Counties on
7th, where considerable cotton was destroyed; in the L
try area on the 10th, Rio Vista on the 12th, and in
eral towns in Hunt County on the 23d; and in Huds
County near Dell City on the 30th.

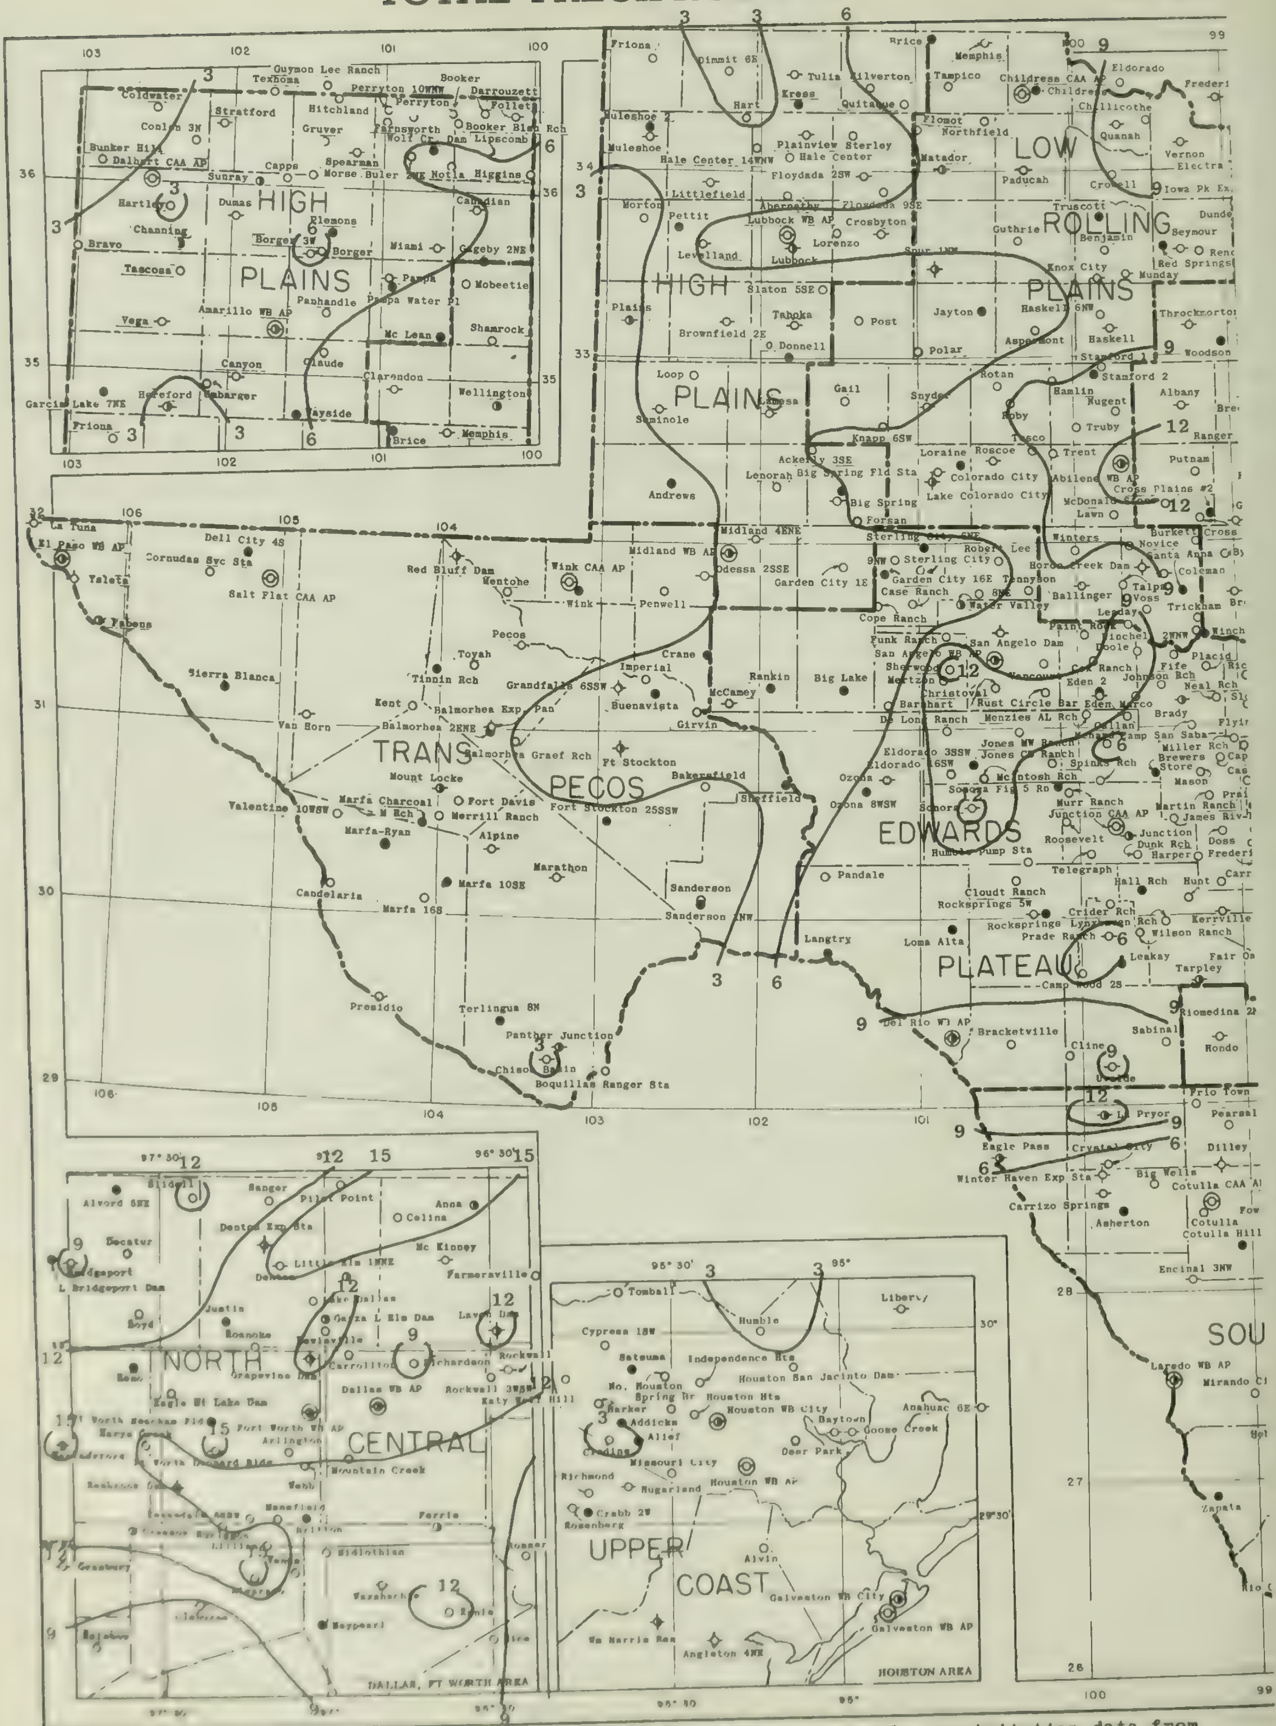
(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER.
MAX AND MIN IN TABLE 6 REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

TOTAL PRECIPITATION

MAY 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

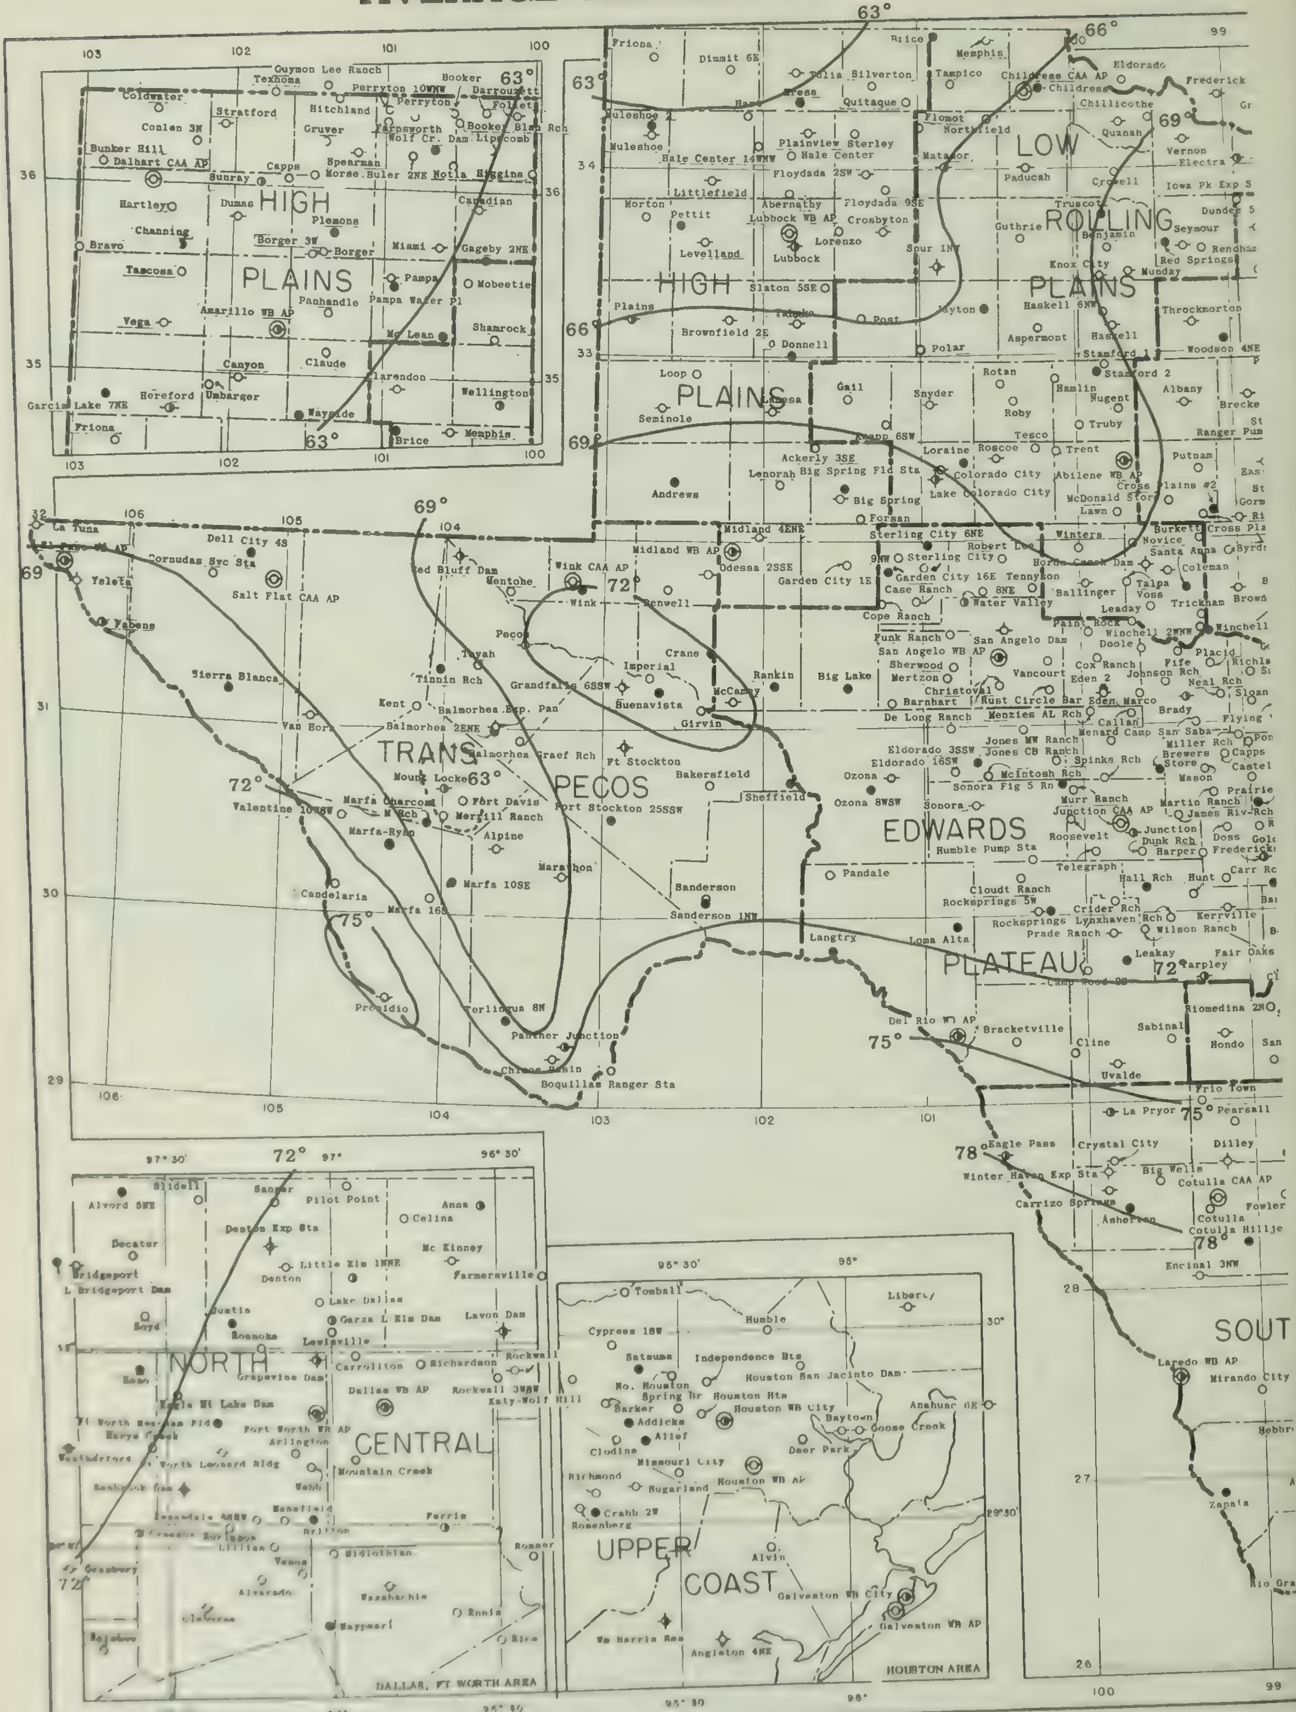
Precipitation, Temperature and Evaporation
Type of gage: ○ Non-recording; ● Recording; ◑ Both types
Double circle combinations indicate the availability of more detailed meteorological data
Revised 12/55 WRPC KC

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

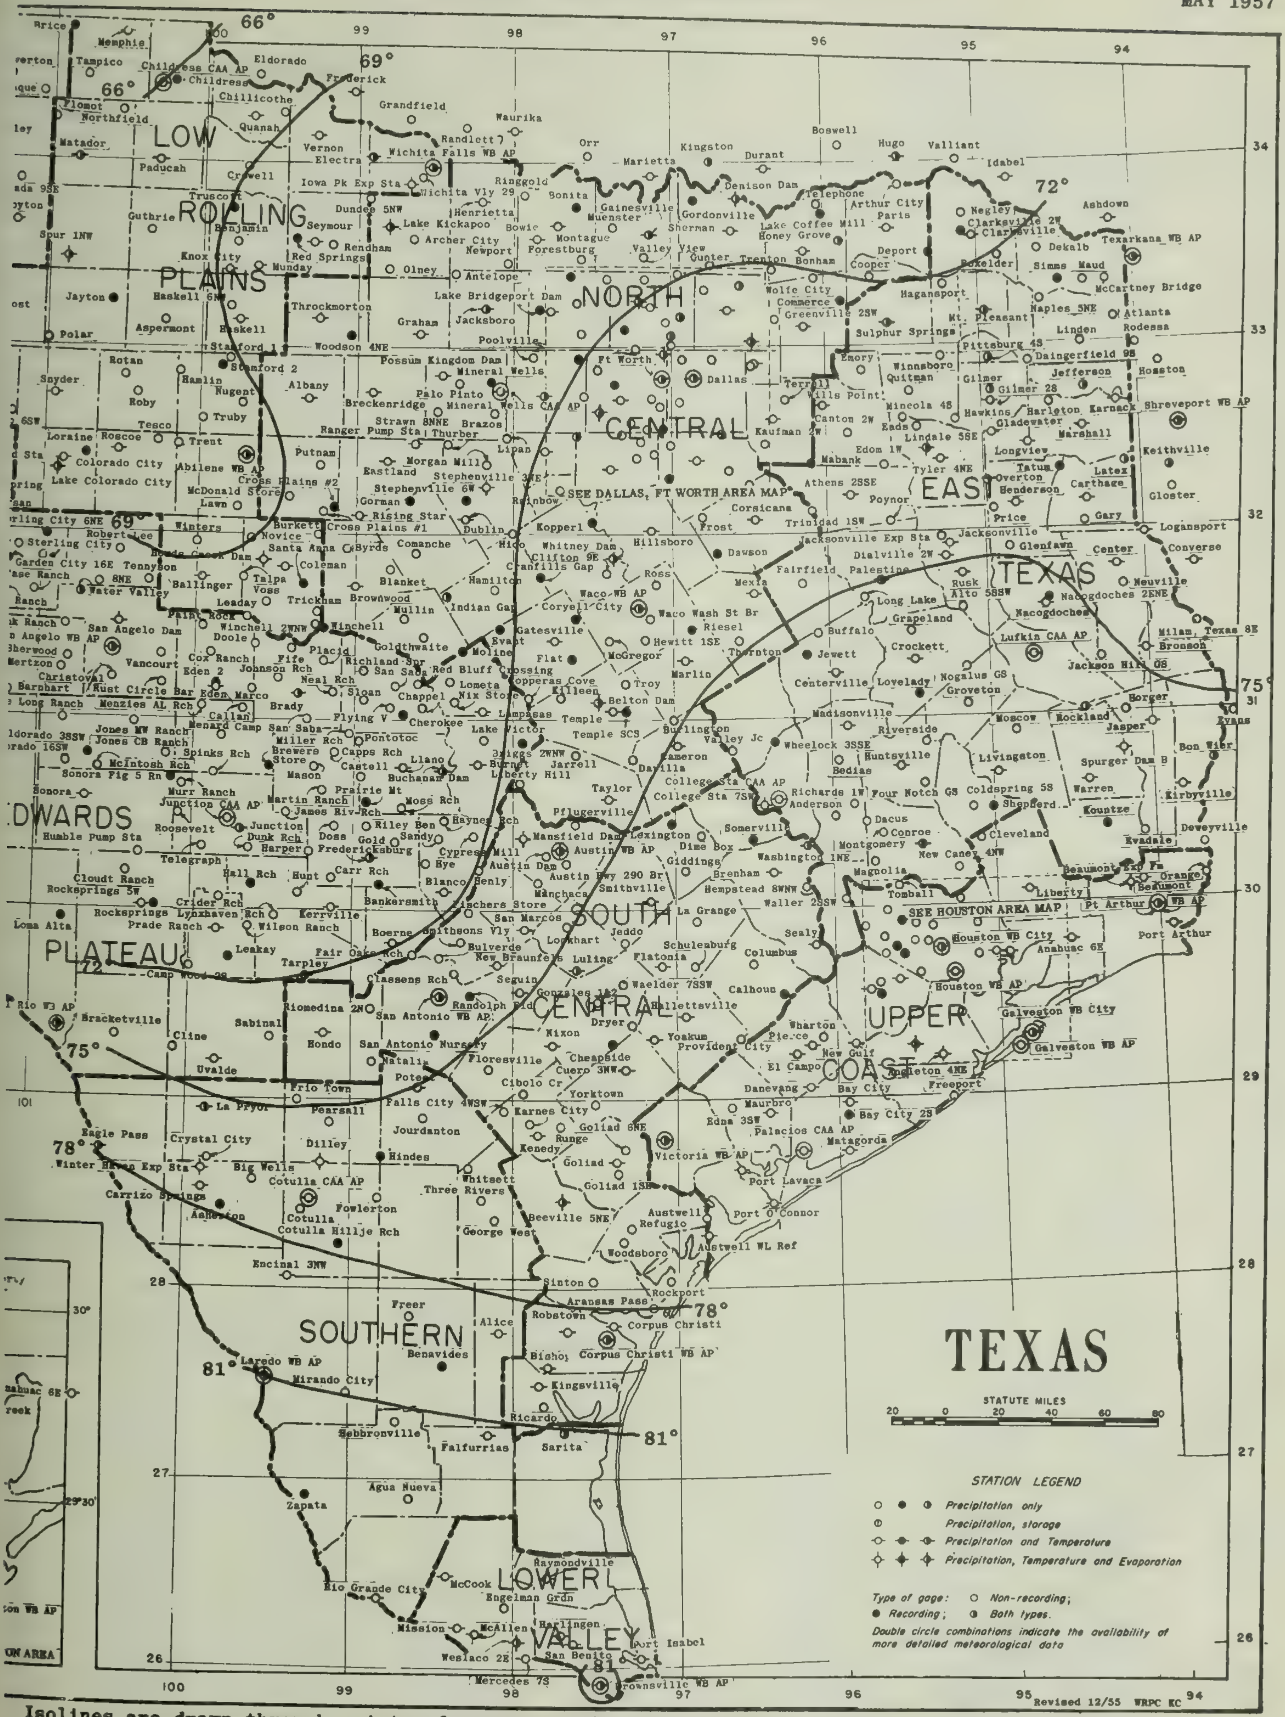
AVERAGE TEMPERATURE



Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

MAY 1957



Isolines are drawn through points of approximately equal values.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times in local standard time. During the summer months some observers take the observations on daylight saving time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
-	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

WEATHER SUMMARY

Comfortable temperatures continued through most of June. Summer heat took over in the last few days. The Trans-Pecos continued very dry. Heavy rains fell over some eastern counties and over parts of the Panhandle. Crops looked promising. Pastures and range feed continued on the upgrade over all areas except the Trans-Pecos.

The first few days of June were cool, cloudy, and rainy. Most stations registered their lowest temperatures for the month during the first few days. Monthly minimum temperatures were in the 40's and lower 50's over the High Plains and the Trans-Pecos, in the middle and upper 50's over the Edwards Plateau, the Low Rolling Plains, and the extreme northern counties of north central Texas and in the 60's over the central, eastern, upper coast, and southern sections. The lowest temperature for the State, 42°, occurred at Mount Locke on the 3d. Rainfall amounts during the first several days of June were light over the Trans-Pecos. Other parts of the State received moderate to heavy thundershowers. The heavy rains brought several rivers to flood stage or higher and caused local flooding in a number of towns.

Skies cleared near the end of the first week of June and the weather turned sunny and hot. Afternoon temperatures over central and southern Texas climbed into the 90's. A few scattered light to moderate showers fell with the heaviest amounts in the northeast. Temperatures continued high and at mid-June averaged slightly above seasonal. Scattered thundershowers continued in most areas during the last half of June. Light showers were fairly general over the eastern two-thirds of the State on the 18th. General rains fell over the Coastal Bend and the Lower Valley from the 19th to 21st. Some Panhandle communities received heavy local showers on the 23d. Plenty of sunshine between the showers kept the temperatures near seasonal. Temperatures during the last week of June averaged several degrees above seasonal. The nights were warm and sticky; the days were hot and sunny. The Panhandle received a few widely scattered showers of little importance. The important rains during the last week were the heavy showers that fell in the extreme eastern part of Texas in connection with Hurricane Audrey. Port Arthur WBAP received 7.35 inches of rain from Audrey on the 27th.

The last few days were especially hot and most stations registered their highest temperatures for the month during the period, 27th to 30th. The highest temperature for the State, 117°, occurred at Presidio on the 29th. This is the highest temperature registered in Texas in any June since June 30, 1907, when the temperature at Big Spring reached 117°. No higher temperature has ever been registered in Texas in June. The maximum temperatures passed the 100° mark at many stations in central and western sections and were generally in the 90's over the eastern parts of Texas. Monthly mean temperatures ranged from 70.2° at Pampa to 86.3° at Laredo. Monthly mean temperatures were below the long-term means at almost all stations. The largest negative departures were, in general, over the Plains counties. Temperature departures ranged from -5.3° at Follett to +3.5° at Marathon.

Precipitation totals for June ranged from no rain at Cornudas Service Station and La Tuna to 13.55 inches at Alvin. Numerous stations in the extreme west Texas received less than one-half inch of rain and a few received less than one-tenth inch. At the other extreme, several stations in the extreme east and a few stations in the Plains received more than nine inches. In general, monthly precipitation totals exceeded the long-term means over parts of the High Plains, parts of the Low Rolling Plains, over east Texas, south central Texas, the Upper Coast, and the Lower Valley. Some areas in the Trans-Pecos received less than one-fourth of the long-term June averages.

Farm work was behind schedule at the beginning of June. Several weeks of cool rainy weather and wet soils had kept the farmers out of the fields. At the end of the first week of June, the skies cleared and temperatures rose. Tractors hummed from dawn to dark as the farmers rushed combining, planting, cultivating, and haying. All crops responded to the good growing weather. Most wheat in the Low Rolling Plains and eastward across north Texas was in the bin or delivered at the elevators by the end of June. Harvesting was in full swing in the central High Plains and a few combines were rolling in the northern High Plains. Feed crop prospects were the best in years. A very good corn yield was in prospect. Grain sorghum combining became active in the Lower Valley and the Coastal Bend. The crop approached maturity in the other south Texas areas. In the northwest, some farmers were still planting sorghums but over two thirds of the acreage was up. Cotton planting was about complete in the north. In the south, peanuts made rapid growth. Broomcorn pulling continued in the south. Dixie Red and Dixie Gem Peaches ripened in the plateau and the harvest of early peaches became active in the northeast. Cotton and rice were late but made good growth. Weeds in the drill rows of cotton increased the requirements for hand labor and more hoe hands were needed in some areas. Hail destroyed cotton in some scattered areas in the High Plains. Prospects continued very promising in the Coastal Bend and Lower Valley. Ginning got underway in the latter district. Watermelon harvest was finished in the Falfurrias are but production increased in new areas, mostly in the south central counties. Melon prospects in the central an eastern counties improved.

Summer range and pasture feed came along fine with ho weather and ample moisture. Weeds grew rapidly, too and sapped the moisture. Some farmers mowed the weeds or applied weed killers to give the grass a better chance Livestock made satisfactory gains on the plentiful gree feed. Scattered showers over the High Plains and along th coast gave the summer grass an additional boost. Spea and needle grass caused some trouble over much of th sheep country. Farmers and ranchers took a lot of tim to treat livestock for screwworms. Horn flies and mos quitoes also bothered livestock. By the end of June, th rank weed growth, competing with grass, dissipated th surface moisture unusually fast. Ample feed was stil available, however, in all parts of the State except th Trans-Pecos and cattle and calves were generally in goo condition.

FLOODS

Heavy rains on June 1 on the middle and lower Nueces an Frio watersheds and over the Gulf drainage areas cause additional flooding on the streams already at or nea flood stages from previous heavy rains. Showers on th 18th of mostly less than an inch except some locally heav amounts of two inches on the extreme upper Nueces and u to three and one-half inches on the Mission River water shed caused minor flooding in those areas. Most of th flooding was on farm and ranch lands. However, the bene fits of increased moisture to the soil probably exceede the damage.

Heavy rains in the Quanah vicinity washed out the Frisc Railway bridge on the Red River north of Quanah and th Texas 283 bridge south of Quanah. The road was stil closed at the end of June. U. S. 287 bridge on the Peas River three miles northwest of Vernon was flooded. Trai fic was delayed but the bridge was not damaged.

STORMS

The number of tornadoes and thundersqualls dropped sharp in June as compared with the previous two months. T highlight of the month's storms was Hurricane Audrey whi affected the extreme upper coastal section on the 27t

A small tornado occurred on the 10th, seven miles sout west of Perryton in Ochiltree County; another on the 12 at Redbird Airport, Dallas; and a third small tornado fi miles north of Plainview in Hale County on the 22d. The were no deaths or injuries from tornadoes during Jun

A serious wind and hail storm struck a number of commun ties in Williamson County on the 12th between 2:00 and 4: p.m. Another windstorm in connection with a thundersqua caused rather extensive damage at Midland, Midland Count on the 23d. A hailstorm centered seven miles west of F Stockton in Pecos County on the 23d injured 26 pers and caused extensive property and crop damage. Two p sons were killed by lightning during the month, one an electrical storm near Livingston, Polk County, on t 19th, and the other at Fort Worth, Tarrant County, on t 23d. Another death occurred at Fort Worth on this s date as high winds overturned a boat on Lake Worth.

Hurricane Audrey formed in the southwest Gulf on the 2 some 350 miles southeast of Brownsville and the cen reached the Gulf coast just east of Sabine Pass the mo ing of the 27th. Nine deaths have been attributed to storm effects, approximately 450 persons were injur and there was extensive property damage in Jefferson Orange Counties and to a lesser degree in Chambers Galveston Counties. Tides were three to four feet ab normal at Corpus Christi, six feet at Galveston, and feet at Sabine Pass.

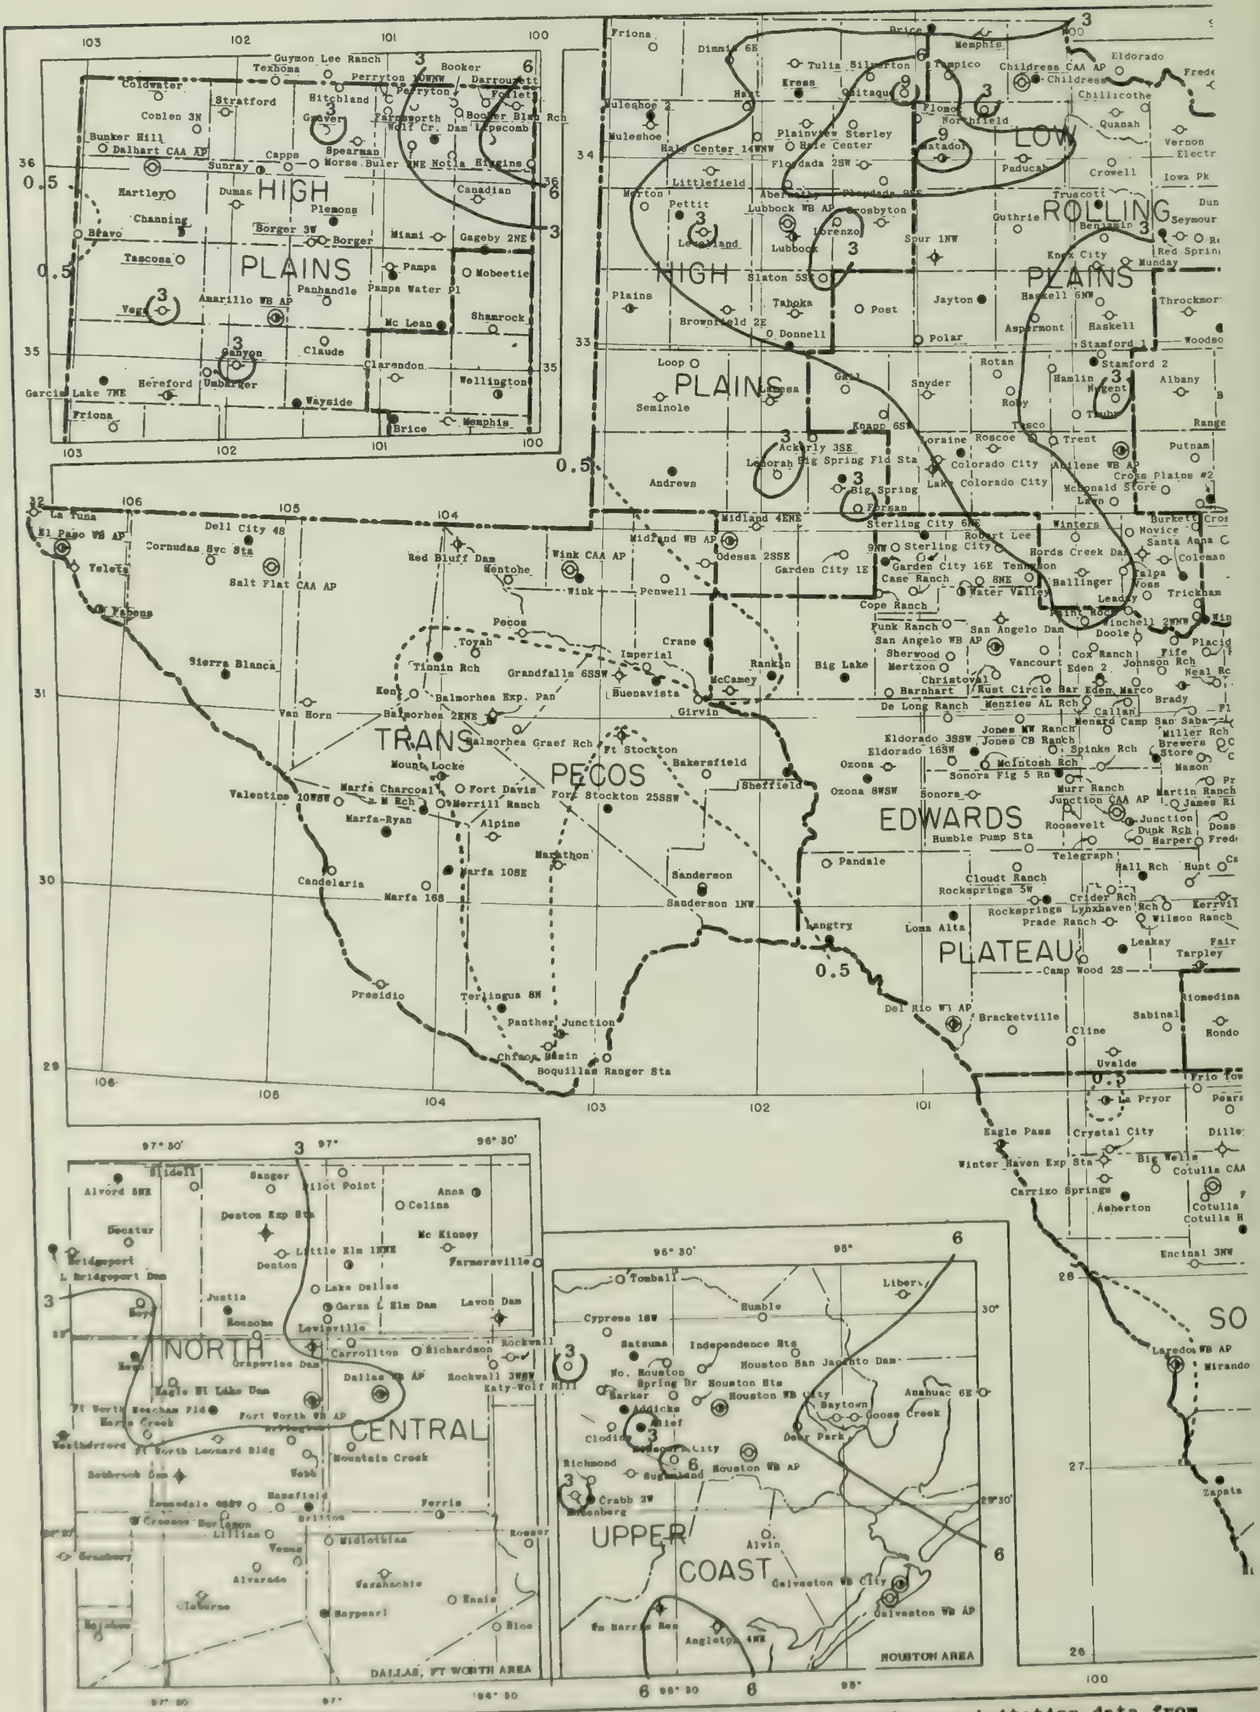
(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER.

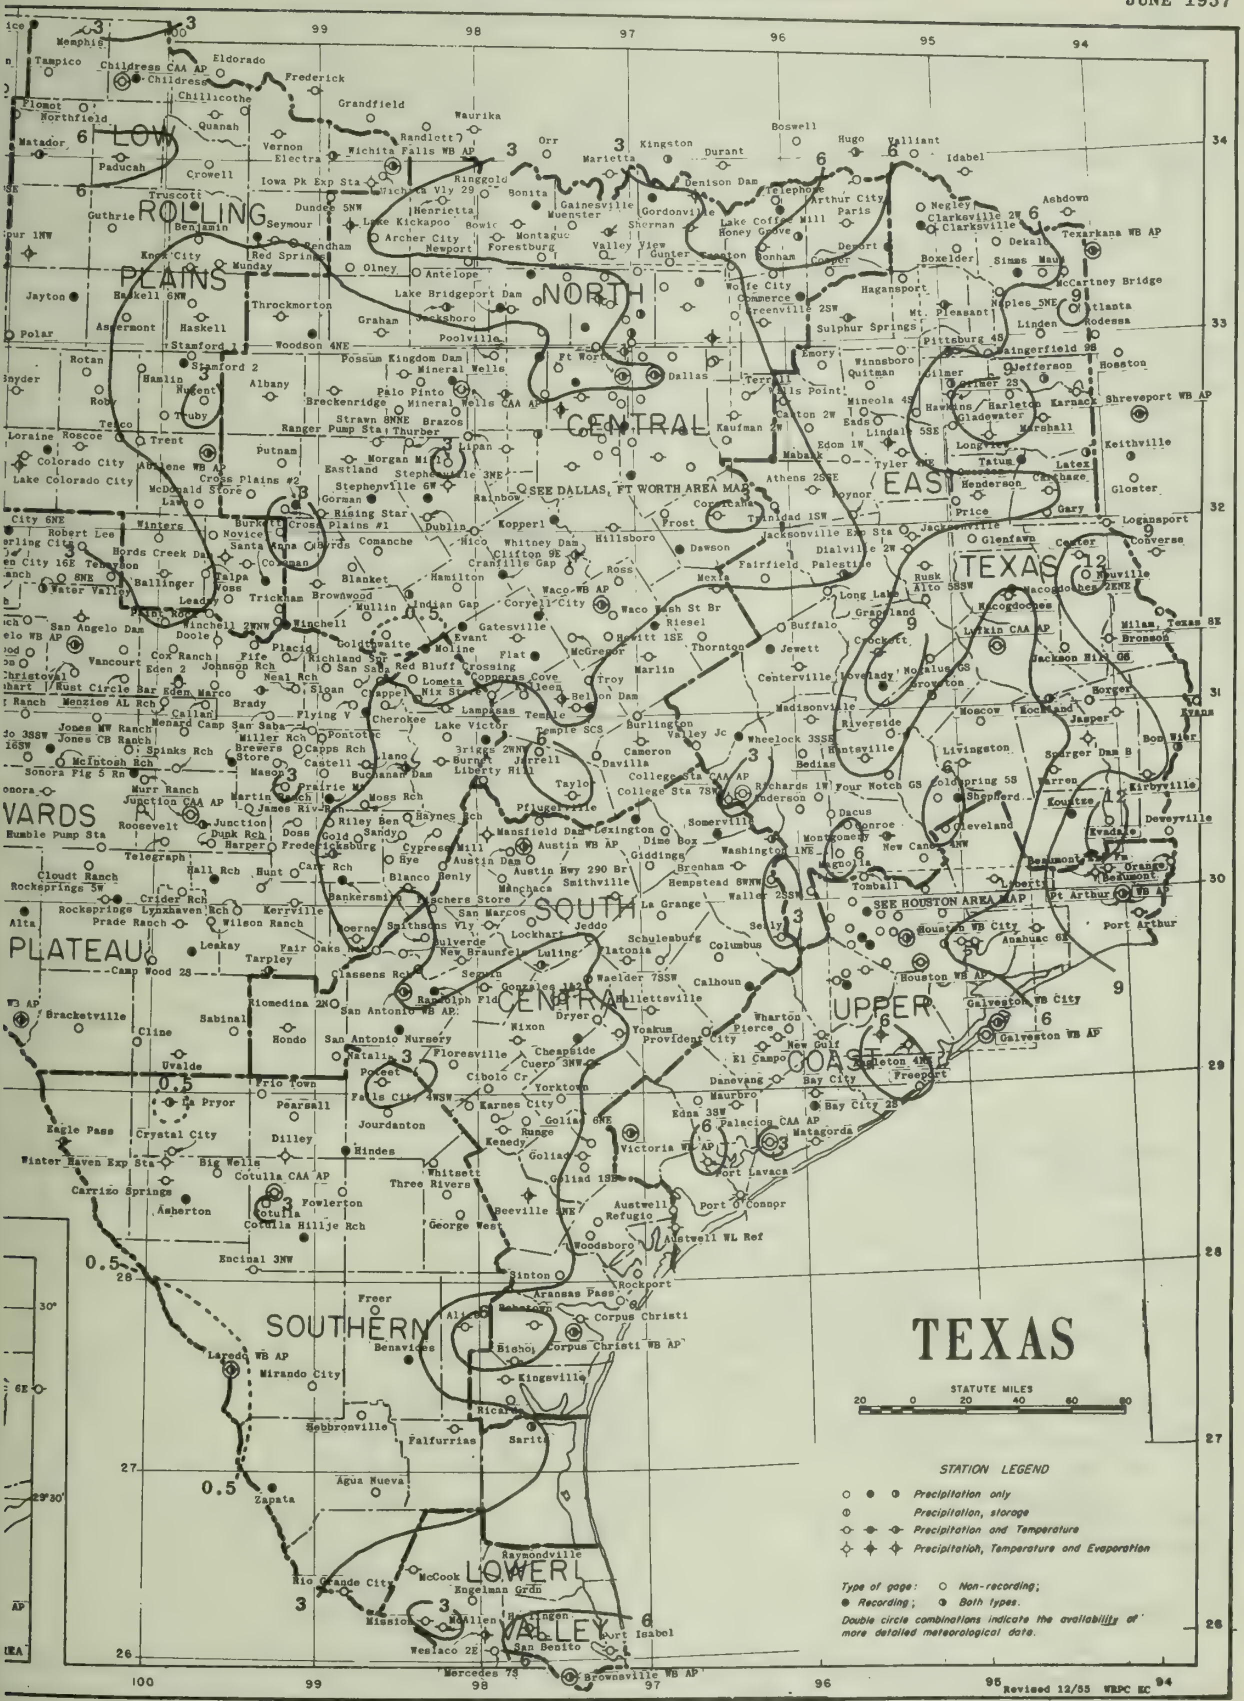
TOTAL PRECIPITATION



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION

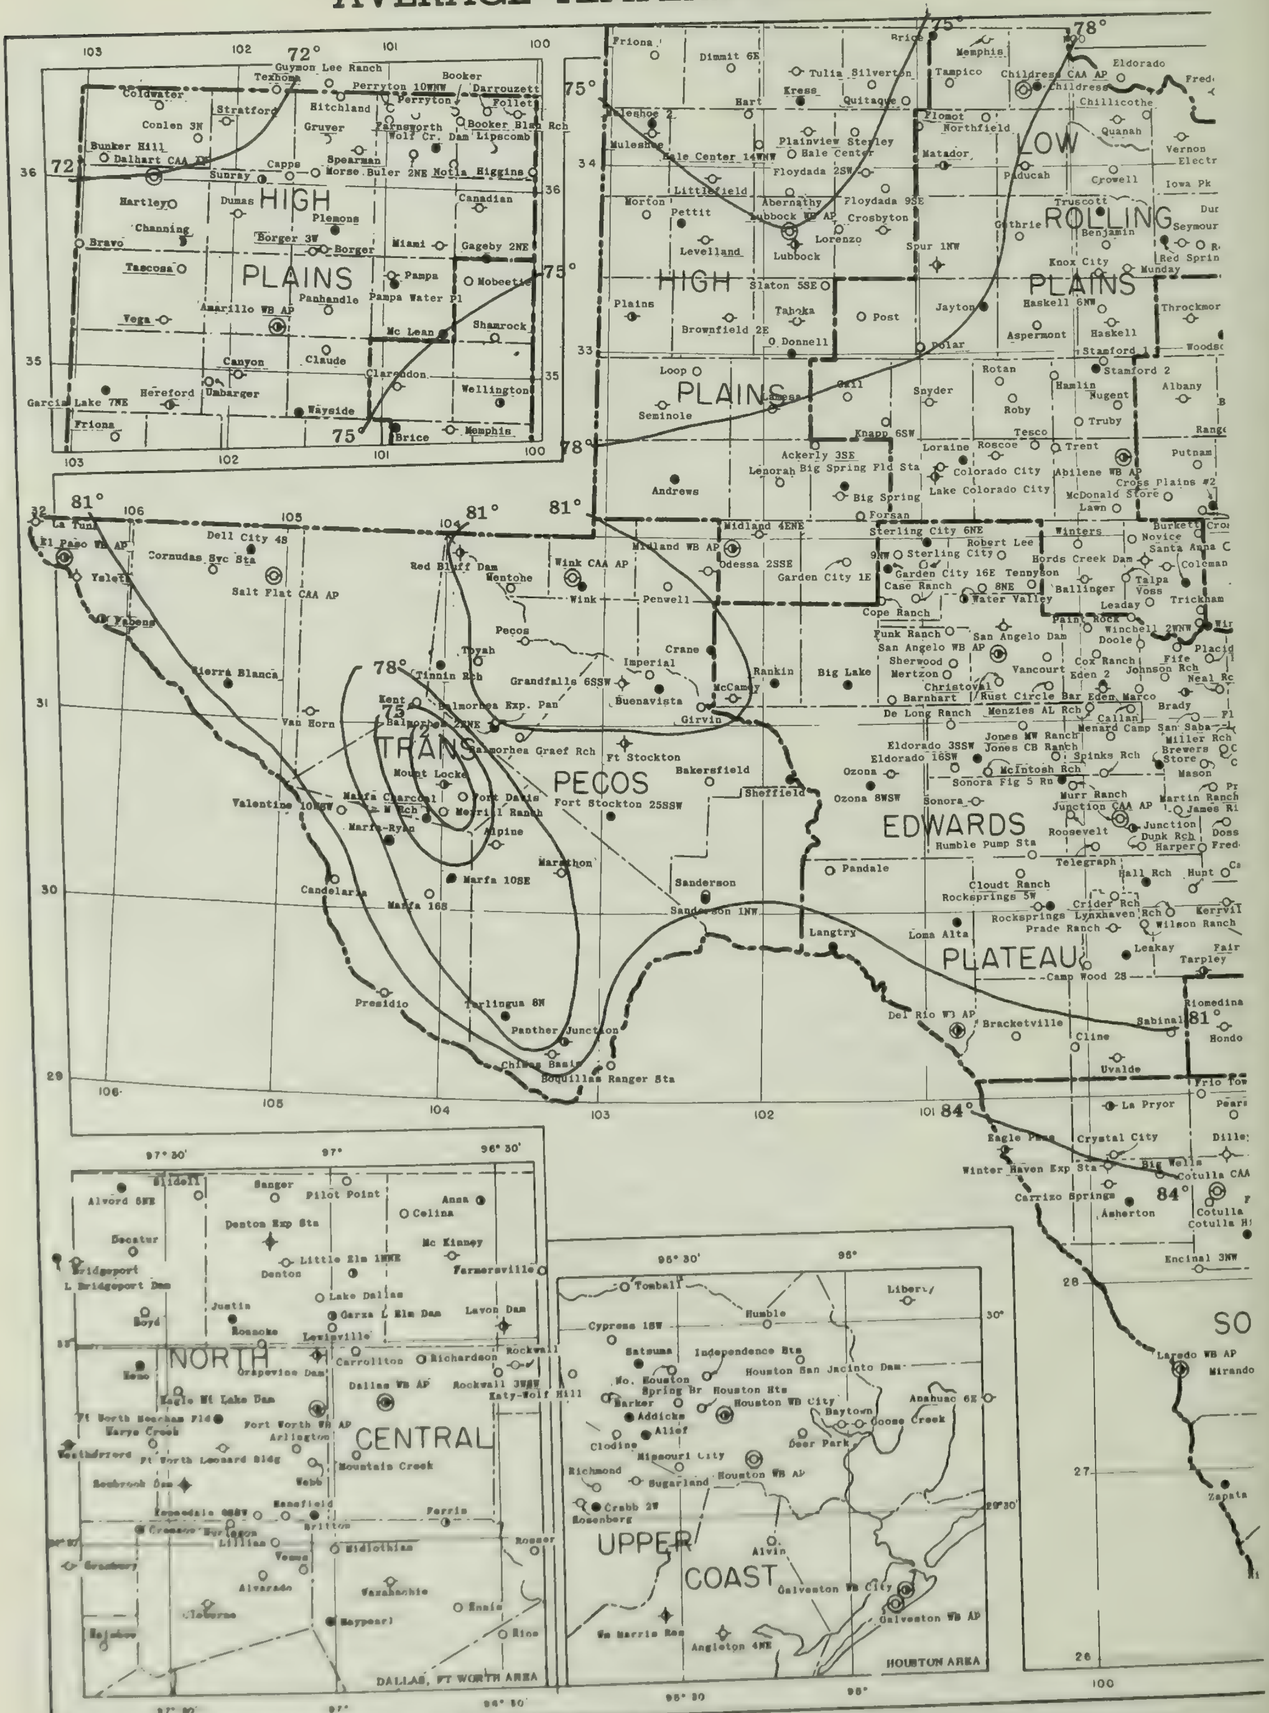
JUNE 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

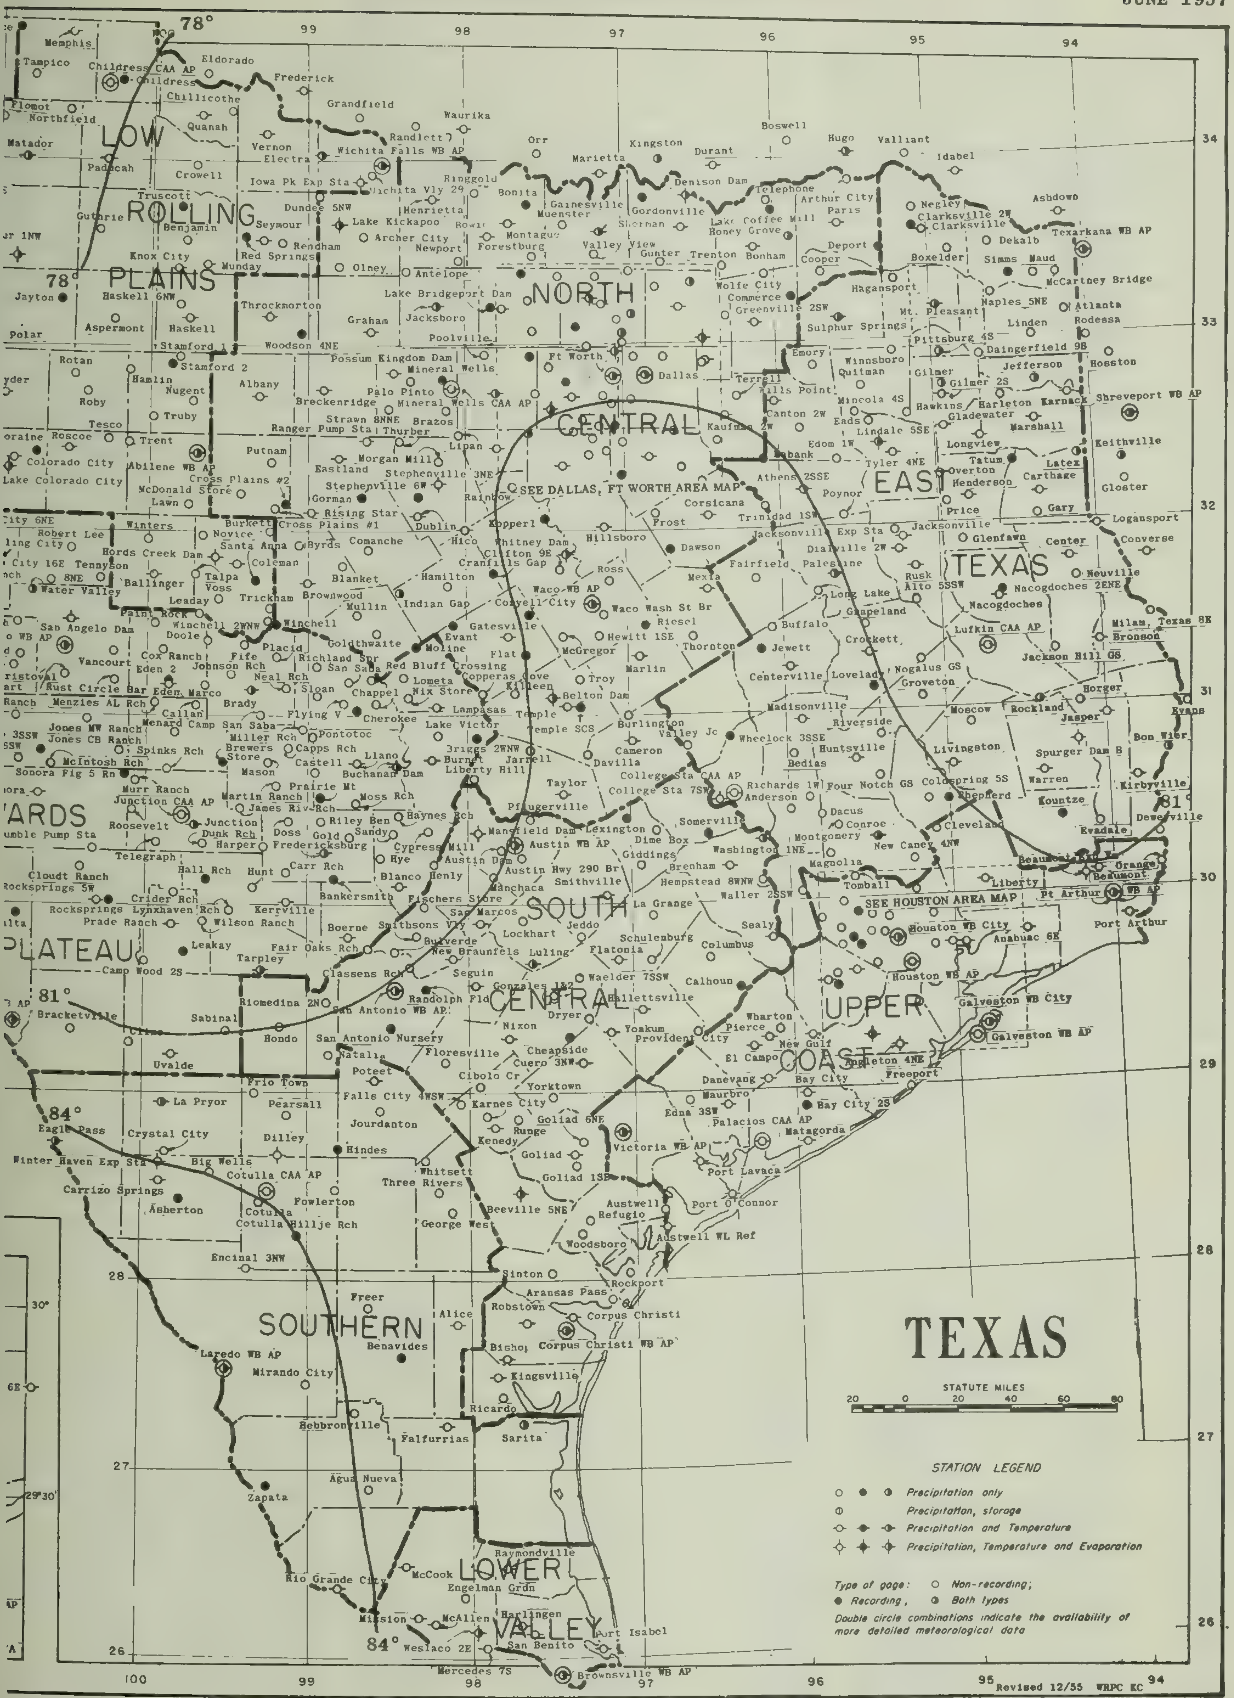
JUNE 1957



Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

JUNE 1957



Isolines are drawn through points of approximately equal values.

This issue contains additional precipitation data for the storm of June 22-23 on Page 159.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times in local standard time. During the summer months some observers take the observations on daylight saving time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price .5 cents.

NWRC, ASHEVILLE, N. C. -- 7-30-57 -- 2150

CORRECTIONS

June 1956: Wichita Falls WB AP, Table 2, mean max should be 95.1.

Wichita Falls WB AP, Table 5, max temperature on 22nd should be 102 and mean max 95.1.

December 1956: Table 3, Delayed Data, Stephenville 3 NE, June 1956, amount on 1st should be .32.

Table 5, Delayed Data, Lake Kickapoo, July 1956, min temperature for 22nd should be 79.

TEXAS

JULY 1957
Volume LXII No. 7

THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS

ASHEVILLE: 1957

WEATHER SUMMARY

July was hot and dry. At numerous stations, it was one of the hottest and driest Julies of record. Showers gave a much needed boost to dryland crops in the Plains and parts of north Texas but, for the State as a whole, rainfall was far below average and more rains were needed. Sorghum combining was in full swing in the Austin area and was getting under way in north Texas. Corn picking was starting in the coastal counties. Very little cotton was ginned except in south Texas.

High temperatures prevailed throughout most of the month. Many stations registered 90° or higher on every afternoon. All stations except five registered 90-degree temperatures on more than twenty afternoons. The afternoon temperatures reached 100° or higher on more than half of the days at some stations. At Laredo, the mercury climbed to 100° or higher on every afternoon except the 11th, and reached 99° on that date. Two stations, Eagle Pass and Encinal 3 NW, registered 100° or higher on every afternoon. Afternoon temperatures at Presidio averaged 106°. The highest temperature for the State, 115°, occurred at Presidio on the 1st. Monthly minimum temperatures were mostly in the 60's but ranged from 56° at Mount Locke on the 23d and 24th to 78° at Galveston Airport on the 4th, 20th, and 21st. Temperatures did not go below 70° at numerous stations in north central Texas, along the Gulf, and along the lower Rio Grande, but dropped below 60° at a few stations in the Trans-Pecos. Monthly mean temperatures ranged from 73.5° at Mount Locke to 91.1° at Presidio. Monthly mean temperatures were below the long-term averages at only a few stations. Monthly mean temperatures at most stations were two degrees or more above average for July.

Except for a few scattered showers in the south central and coastal areas on the 9th, the dry pattern persisted through the first two and a half weeks of July. Thunderstorm activity produced scattered showers from the 17th to 24th. Mostly fair weather prevailed during the last week of the month. Rainfall was very unevenly distributed over the State. Corpus Christi Airport was one of the numerous stations in the southern part of Texas which received no rain during the entire month. July 1895, 1897, and 1957 were the only Julies since 1887 in which no rain fell at Corpus Christi Airport. Laredo received a light sprinkle on the 9th. At Laredo, it was the driest July since 1924 when not even a sprinkle fell. Del Rio received a sprinkle on the 22d. Other dry Julies at Del Rio were 1951, 1953, and 1956. However, in July of those years, sprinkles fell on two or more days. The sun was shining at Corpus Christi 98 percent of the time it was above the horizon, setting a new record. The average for July is 86 percent.

Many counties in all sections of Texas received less than one-half inch of rain. Most counties in the extreme east and several scattered areas received more than two inches. The greatest monthly total, 6.00 inches, fell at Port Arthur Airport. About seven percent of the stations received rainfall in excess of their long-term averages but more than one-fourth of the stations received less than ten percent of their average July rainfall. For the State as a whole, it was one of the driest Julies of record.

The hot sunshiny weather was ideal for combining grain, cultivating row crops, and curing high quality hay. Combining wheat continued in full swing until the work was completed about the middle of July. Plowing for next year's crops started immediately. Sorghum grain harvest in the Coastal Bend and Lower Valley was also completed by about July 15. Yields were above average. High Plains sorghums were being irrigated. Rice, although late, made satisfactory growth and the earliest fields were headed. Elberta peaches began moving to market from the east Texas orchards. South Texas broomcorn harvest reached the final stages.

The hot dry weather continued. Afternoon temperatures climbed to 100° in almost all parts of the State. The desiccating winds wilted the feed crops and pastures. A few widely scattered showers fell over the central, southern and coastal counties during the third week and over the northern half of the State during the last week of July, but most counties needed abundant general rains. The isolated showers softened the old grass but were ineffective in starting new feed. Needle grass, burrs, and screw worms became troublesome. Although the gras was dry over most of the State, all classes of livestoc continued in fair to good condition. Marketings of cattl and lambs were moderate.

Irrigated crops looked promising. The widely scattere showers helped the crops in a few localities. In mos areas, corn was too far advanced to be helped by rain Grain sorghum combining was underway as far north as Temple. Late sorghums were helped by the showers but wer in the critical boot or early headed stage and neede more rain. A considerable acreage over a wide area fro east Texas northwestward to the southern High Plains wa in that stage. The showers revived the peanuts in th Cross Timbers and in north Texas. Peach picking continue as the early varieties ripened. Broomcorn pulling bega in the Coryell-Lampasas area.

Cotton ginning hit the season's peak in the Lower Valle near the end of July. A few fields of stalks were plow in preparation for next year's crop. Cotton harvest became active in the Coastal Bend. Bolls were maturin fast in the south central counties. In the north an northwest, cotton continued to put on fruit but neede rain. Fleahoppers became numerous in the northwest an control measures were needed. Boll worms became troublesome in the southeast, especially in the upper coast counties. The plants bloomed profusely in the Trans-Pecos.

Cantaloup harvest was underway in the Trans-Pecos. Wate melon harvest neared completion in the south central cou ties but melons moved in good volume from east Texas. La preparation for fall vegetables began in south Texas a growers in the Lower Valley began planting such fall ve etables as parsley, eggplant, and peppers.

STORMS

The month of July was free of damaging storms during t first three weeks, with the exception of a windstorm July 1. Near Plains in the Panhandle winds estimated 90 mph with gusts even higher brought blinding dust a sand, damaged roofs and small buildings, blew down a gra ary, damaged phone lines and equipment. Hail of marb size destroyed crops over a 300-square mile area.

A young man working on a farm near Beaumont was kill when struck by lightning on July 19.

Windstorms during the last 12 days of the month did so damage in the northern part of the State. On July in Navarro County, northeast Texas, a tenant house w destroyed, roofs were damaged and windows broken duri a thunderstorm. In the Panhandle near Plainview, on Ju 21, high winds and hail damaged or destroyed some bui ings, cars, cotton and feed crops, and overturned a trai house. On the 23rd a "freak twister" at New Ulm, Aust County in east Texas, picked up and demolished a ba causing no disturbance on nearby land. On July 30 str winds during thunderstorms tore down power and teleph lines, moved a few small buildings, and damaged a car the Snyder area of Scurry County. Hail damaged cro including cotton.

Lightning struck a house in Mount Pleasant, east Tex on July 23, destroying three rooms and furnishings. the 24th a funnel was sighted in Crosby County in Panhandle, and on the 30th another funnel was repor near Trent, 20 miles west of Abilene in Taylor Coun A small tornado was reported to have touched ground brie east southeast of Plainview in Hale County on July This was unconfirmed; no damage was reported.

(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER.
MAX AND MIN IN TABLE 6 REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times in local standard time. During the summer months some observers take the observations on daylight saving time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

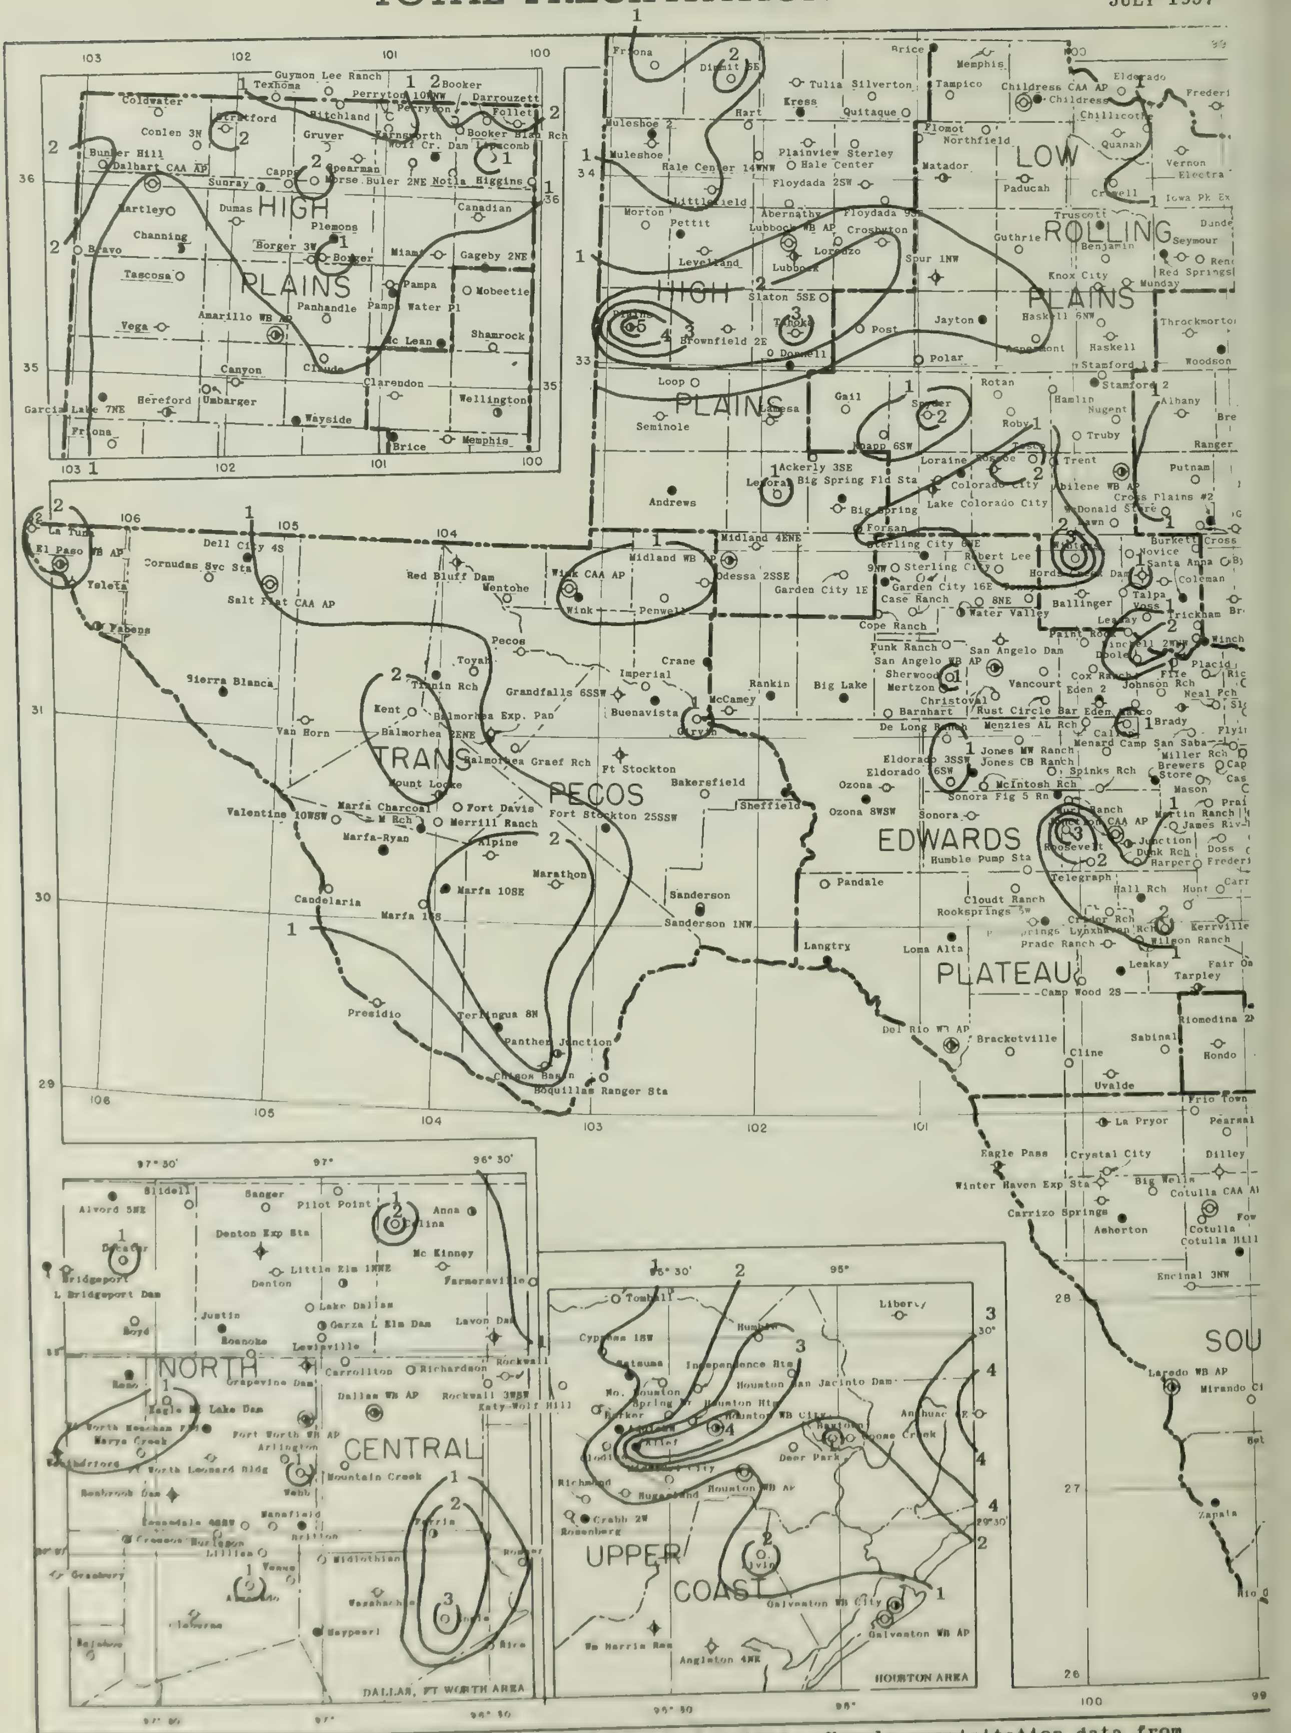
-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 9-5-57 -- 1650

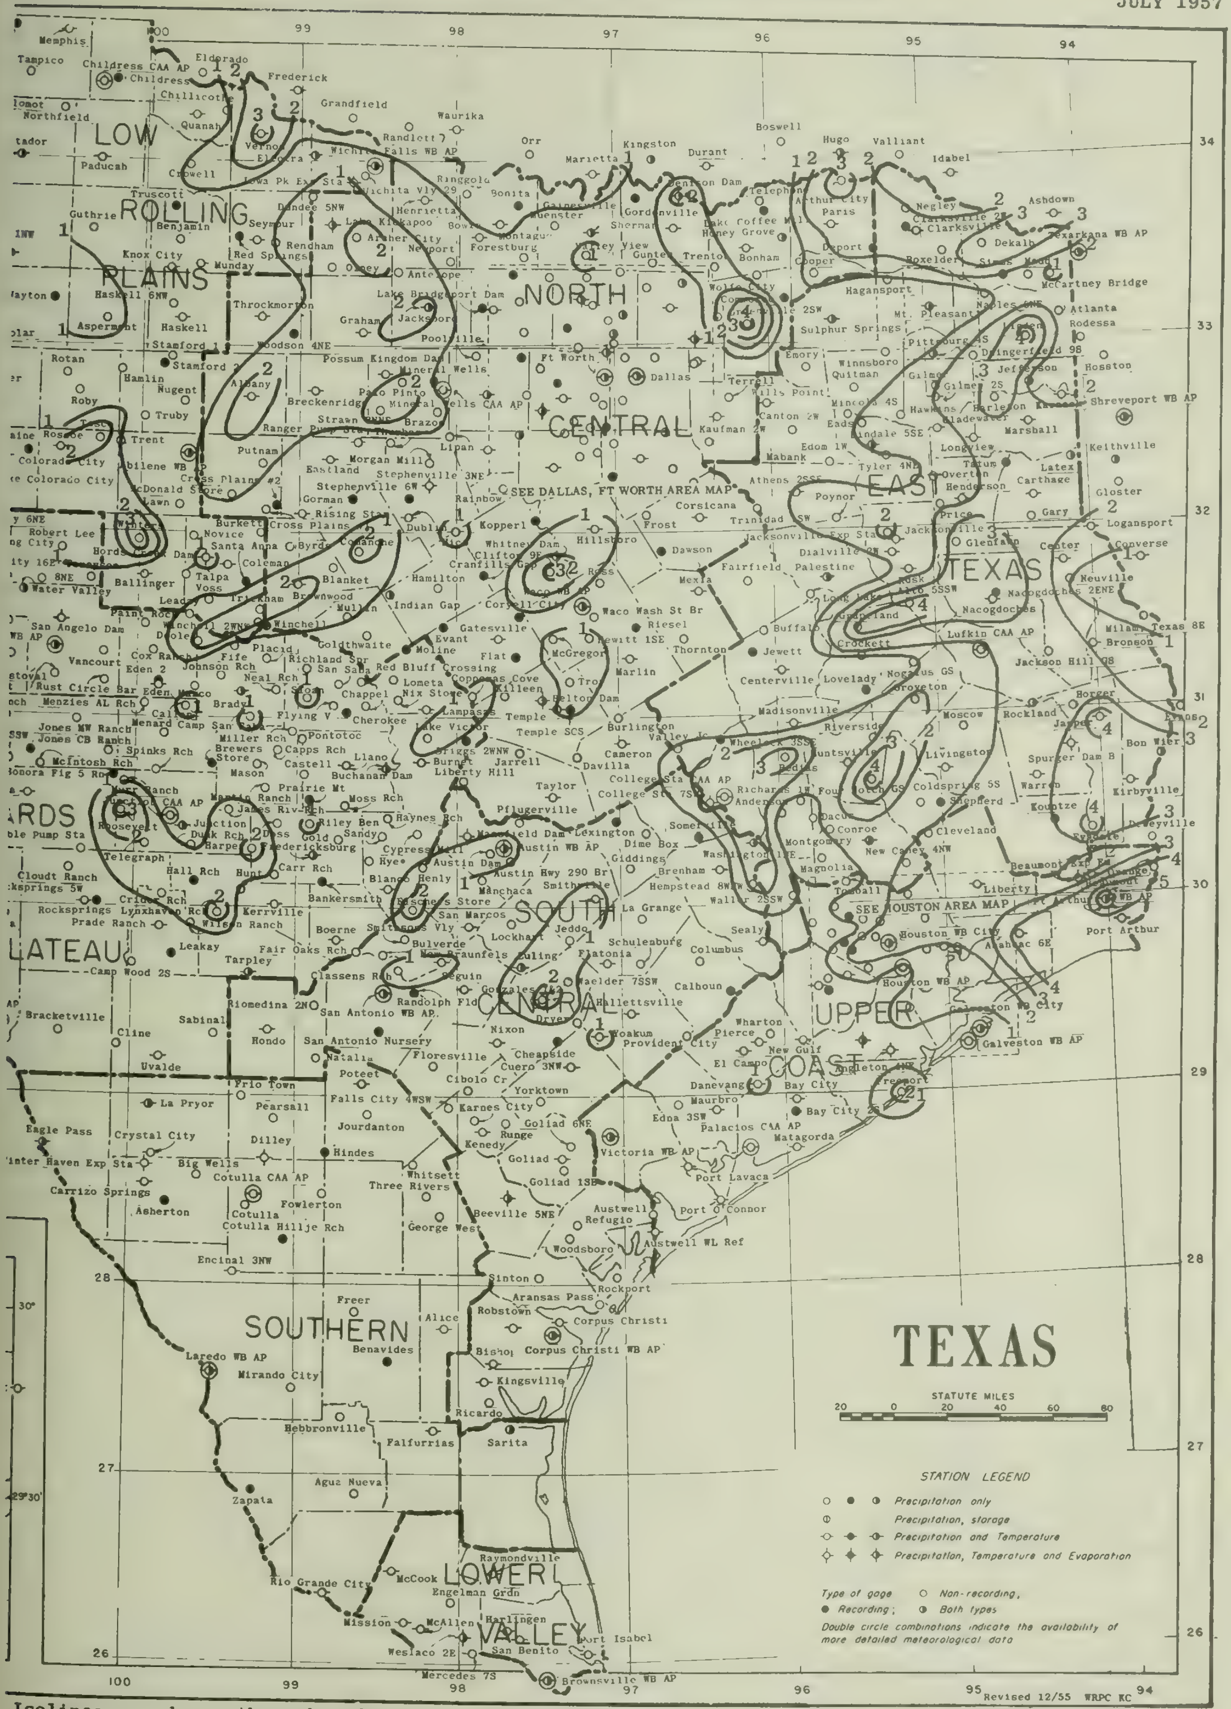
TOTAL PRECIPITATION



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION

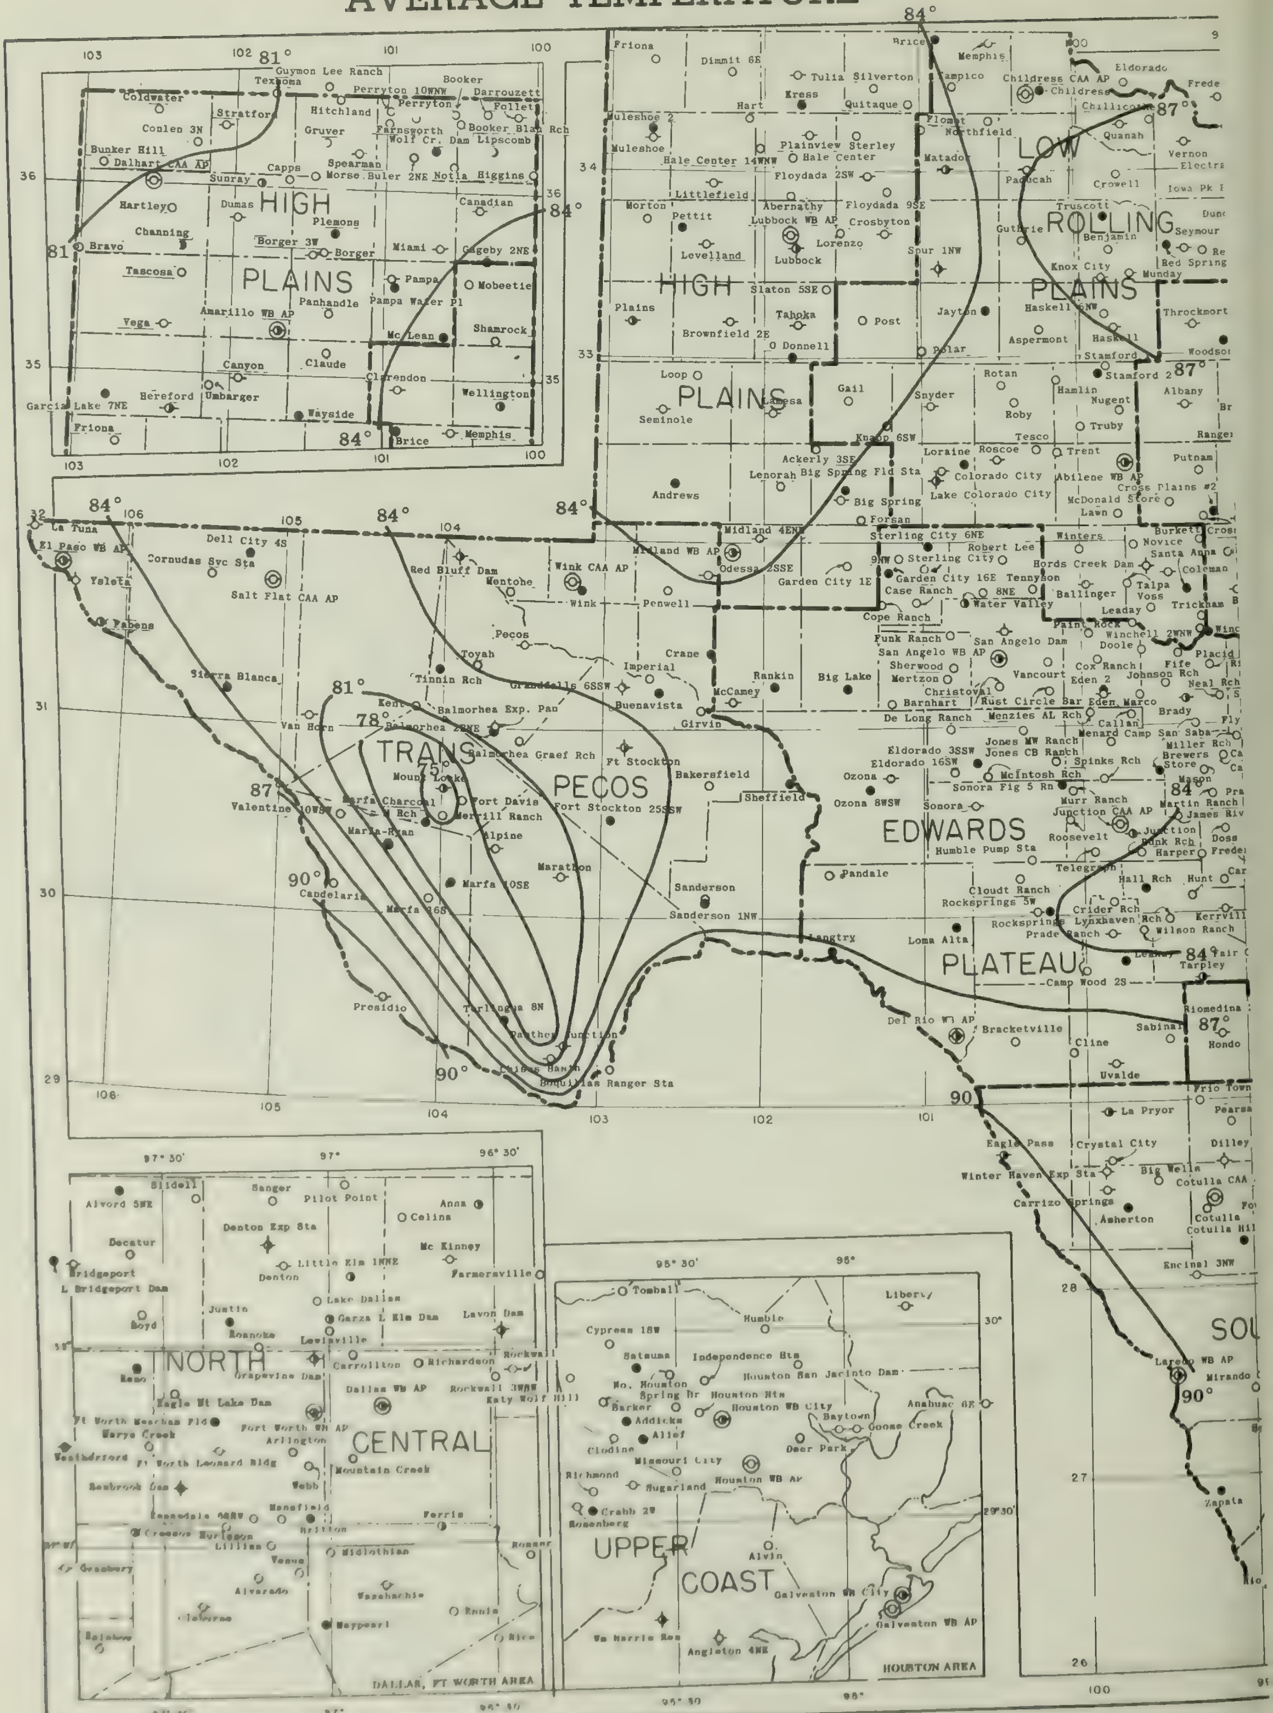
JULY 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

JULY 1957



Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

JULY 1957

AUGUST 1957
Volume LXII No. 8

ASHEVILLE: 1957

WEATHER SUMMARY

August was hot and dry over most of Texas. A small part of east Texas averaged slightly cooler than seasonal and received abundant rains. The hot dry weather was favorable for field work. The scattered rains gave relief from the droughty conditions in some localities but many areas needed more rain.

At the beginning of August, afternoon temperatures came close to or exceeded 100° in almost all sections of the State. A cold front brought slightly lower temperatures on the 4th and 5th to most sections of the State. The milder weather continued from the 5th to 11th over the northeast. Hot weather returned to most of the State and afternoon temperatures again approached or exceeded the 100° mark. A cold front on the 15th and 16th was followed by milder temperatures over the northeast, Panhandle, and extreme west. The final week was mostly hot but turned cooler at the end. The extreme temperature range was from 53° at Albany on the 20th to 110° at Possum Kingdom Dam on the 25th. Monthly mean temperatures ranged from 70.6° at Mount Locke to 89.5° at Rio Grande City 2ESE. Monthly mean temperatures were slightly below seasonal at most stations in east Texas but were above the long-term means at most stations over the rest of the State.

A cold front set off light to torrential thundershowers over much of the High Plains and spots across north Texas during the first week of August. About the middle of the second week, Hurricane Bertha dumped rain torrents over a narrow strip in east Texas and light showers outside that area. Light but generally ineffective showers also hit spots in the Blacklands and in the High Plains. A cool front that advanced southward on the 17th and 18th set off showers at a number of localities. Showers during the rest of the month were mostly light and widely scattered. There were a few heavy amounts, however. For instance, two inches of rain fell at El Paso during a brief shower. The rainfall was very unevenly distributed over the State. Numerous stations over the Trans-Pecos, Edwards Plateau, southern Texas, and north central Texas, and a few stations in the Low Rolling Plains and the south central section received no rain or only light showers of little consequence during the entire month of August. A few widely scattered localities throughout the State and several stations in east Texas received more than four inches. Several vicinities received more than six inches. The greatest rainfall total, 12.57 inches, fell at Long Lake. Precipitation at several stations in east Texas and in the Panhandle and a few widely scattered stations received precipitation in excess of their long-term August means. A few stations received several times their long-term means. The great majority of counties, however, received far less than seasonal rainfall. Many stations in the Trans-Pecos, Edwards Plateau, and southern Texas received less than one-fourth their long-term averages for August.

Showers early in August gave a much-needed boost to cotton, feed crops, and pastures over the High Plains and in spots across north Texas. They provided moisture for bringing up the volunteer wheat for fall grazing. They improved the feed crop prospects in the Panhandle. Irrigated sorghums made satisfactory growth. The earliest grain sorghum was blooming. Sorghum combining was going full tilt in central Texas. The hot open weather was favorable for the harvest which spread northward and northwestward. By the end of the month, sorghum combining was general over northern Texas and was under way in the Low Rolling Plains. Yields were spotty, ranging from only fair to unusually good. Hybrids showed considerable promise. Dryland sorghum in the High Plains was the best in years. As usual, irrigated sorghums promised high yields. The hot dry weather was also favorable for corn picking. The corn harvest was well under way in central Texas and spread into the Cross Timbers and north Texas. Hay baling was completed after one of the best haying seasons in years. Hay and feed supplies were the best in many years.

North Texas peanuts were promising but needed rains. Continued dry weather caused deterioration of the peanuts in the Eastland-Comanche area. Rice harvest gained momentum. Yields were high and prospects for the unharvested portion of the crop were promising. Sweet potato harvest began in some early east Texas fields.

In the northern Panhandle, early seeded wheat came up and additional acreage was planted. Preparation of land for seeding small grains made little progress outside the High Plains because of the dry soil.

At the beginning of August, cotton harvest was underway in extreme southern Texas. By the end of the first week, ginning had past the two-thirds mark in the Lower Valley and the harvest in the Coastal Bend was at the peak. The outturn in that area reflected the dry weather during the growing season. Dryland cotton in other districts continued to make fair to good development although much of the acreage was beginning to suffer from lack of moisture. Early cotton on irrigated acreage in the northwest fruited heavily. The outlook was favorable. Prospects in the Trans-Pecos continued promising. Leaf worm infestations were widespread and were particularly troublesome in the Low Rolling Plains. The open weather favored effective insect control measures.

The cotton harvest spread northward. In spite of the droughty conditions, the cotton in east Texas, the Blacklands, Low Rolling Plains, and High Plains, continued to fruit heavily. The insect pests were prevalent but control measures were generally effective. Leaf worm infestations subsided. Fleahoppers became bothersome in the Low Rolling Plains counties. Dry weather and insects caused the yields in the central, southeastern, and upper coastal counties to be disappointing. Prospects over the northern part of the State were generall much better. Scattered rains brought some relief and the insect control measures were fairly effective. The nort Texas and Plains crop was late. Irrigated acreage in the High Plains and the dryland acreage that received rai made good growth and fruited heavily. Spotted rains helpe the crop north of Waco, but more rains were needed for full development. By the end of the month, the cotton north o Waco was still holding up good with the earliest planting beginning to open. Dryland acreage in the High Plains responded to the scattered showers and continued to show goo prospects. Irrigated cotton in west and northwest Texa fruited heavily. The main hazard in the High Plains wa the lateness of the crop. The August rains missed part of the Low Rolling Plains. Those parts needed rain t check excessive shedding and to size the bolls. In th Lower Valley, scrapping and shredding stalks continued

Weather conditions were mostly favorable for the comple tion of the harvest of summer vegetables and for plantin vegetables for fall and winter harvest. The outstandin exception was in the nonirrigated areas of south Texa which remained too dry for active field work. At the beginning of August, the melon harvest had passed the pea in all localities in the eastern and northeastern counties and was finished in some localities. Some late onions and potatoes were harvested in the Panhandle. Harvest of cantaloupe increased in the Pecos and Fort Stockton areas, the main source of supply for the remainder o the season. Some planting of fall and winter vegetable was accomplished before the middle of August. Lettuce an carrots were planted in the Panhandle. Late peppers an tomatoes were being planted in the Lower Valley and planting winter-type vegetables started in the Winter Garde and at Eagle Pass.

By the middle of August, harvest activity in the comme cial summer vegetable areas was reaching the clean- stage. The harvest of early fall vegetables had start and the planting of late fall and winter vegetables co tinued. Carrot harvest in the northwest was light but i creasing. Most of the peppers and tomatoes in the sou were transplanted and the planting of other tender veg tables became active. Seeding carrots increased in t Winter Garden and considerable areas of broccoli and ca liflower were transplanted. Most spinach land was pr pared for planting in September. Onion beds were rea in most irrigated areas. Onion seeding got under w during the fourth week. The fall-crop vegetables, main carrots and lettuce in the north and tender vegetabl such as beans, eggplant, peppers, and tomatoes in t extreme south, were then in good condition. Peppers a tomatoes in the extreme south were in good condition co sidering the weather. Broccoli and cauliflower tran plantings were in fair to good condition. A few wate melons and cantaloupe were still being harvested but t movement was mostly light. Most of the potatoes we dug and a considerable tonnage of onions was still avai able.

At the end of August, the fall and winter vegetable pro pects continued favorable. Plantings were made in irr gated land and water was ample. Carrot harvest increas in the Panhandle and volume supplies were expected

WEATHER SUMMARY (Continued)

continue into December. Lettuce in that area was in fairly good condition but some fields were weedy. Harvest was expected to start by mid-September and to continue light until early October. In south Texas fall crop tender vegetables, mainly broccoli, carrots, and cauliflower, were making fairly good progress. Most land was pre-irrigated for planting additional winter vegetables. Non-irrigated areas in south Texas remained too dry for active field work.

August rains, ranging from light showers to torrential downpours, greened the pastures and ranges and brightened the late summer range and feed prospects in some parts of Texas. Other parts continued dry. Some places which received rain needed more. The areas which benefited by the showers were the Panhandle, the Trans-Pecos, east Texas, High Plains, and the western Plateau. Although torrential downpours hit spots in the Trans-Pecos, that area needed frequent rains to revive the drought-depleted ranges. Grass was still dry over the major portion of the State, from the Cap Rock to east Texas. In the Plateau, central, and southern counties the dry grass was short and livestock continued to show shrinkage. Stalk fields in parts of those areas were being grazed. Contracting for fall delivery of calves was brisk in a number of western counties. Goat shearing was in full swing in the Plateau. Lambs moved in volume from some Plateau counties. All classes of livestock continued in fair to goo condition but showed the effects of hot dry weather.

STORMS

Hail, lightning, and wind caused scattered damage to crop and other property on several days during August. Much o the damage was relatively minor and details of the storm are not included below. For more complete information regarding storms and storm damage in Texas, the reader is referred to Climatological Data, National Summary.

On the evening of August 12, strong winds in the Denis vicinity damaged trees and television antennas and smashe boats and boat houses at the Texoma resort. During th afternoon and evening of the 28th, hail, heavy rain, a strong winds destroyed considerable cotton and feed the McLean area.

An airplane crashed at El Paso during an early morni thunderstorm on the 31st.

[illegible] MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER.
[illegible] REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times in local standard time. During the summer months some observers take the observations on daylight saving time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

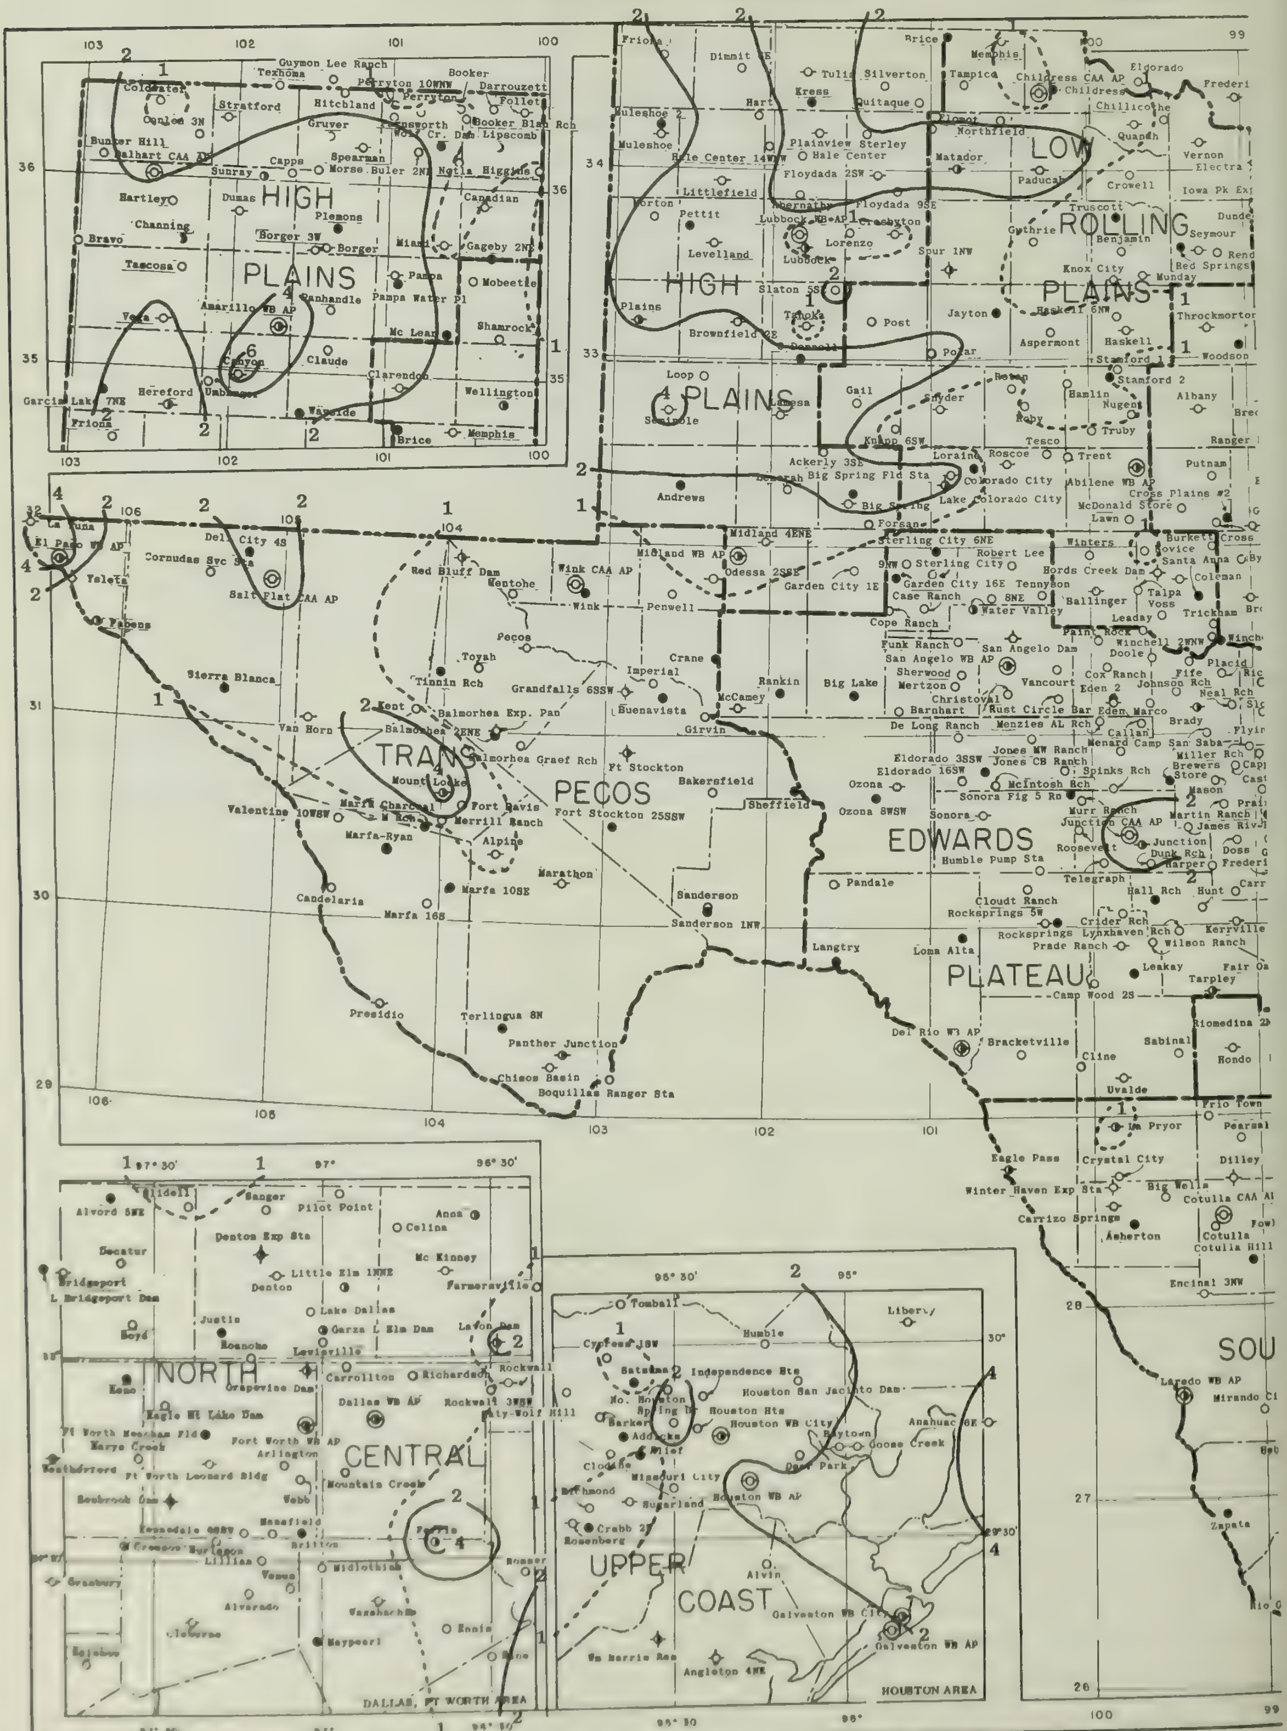
Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 10-9-57 -- 1650

TOTAL PRECIPITATION

AUGUST 1957



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

ASHEVILLE: 1957

WEATHER SUMMARY

September rainfall was above average over the eastern two-thirds of Texas. A slow soaker during the third week interrupted harvest but revived the peanut crop, made possible a fourth cutting of alfalfa in some sections, brought up fall range grass, and put the ground in ideal condition for fall plowing and planting. Lesser amounts of rain over the High Plains sprouted the early planted wheat.

After hot weather the first week of September, temperatures became pleasantly mild. The cooler-than-seasonal temperatures continued to the end of the month except for a few days near the middle of the month. Most stations registered their warmest temperatures for the month during the first few days of September. Several stations in the Trans-Pecos registered their highest afternoon temperatures during the mid-month warm period. Monthly maximum temperatures ranged from 89° at Galveston Weather Bureau Office on the 1st and at Mount Locke on the 19th to 107° at Hico on the 2d and at Presidio on the 9th. The monthly maximums reached 100° or higher at many stations. Many stations registered their lowest temperatures for the month on the 8th, 9th, 15th, from the 22d to 24th, or during the last few days. The monthly minimums were mostly in the 40's and 50's. Minimums were 60° or higher at most stations near the Gulf. The coldest temperature for the State, 38°, occurred at Vega on the 15th. Monthly mean temperatures ranged from 64.9° at Stratford to 83.9° at Rio Grande City 2ESE. Monthly mean temperatures were above the long-term means at a few stations in the Trans-Pecos and a few in the Lower Valley but were cooler than the long-term averages at most stations elsewhere. The monthly temperature departures ranged from +3.8° at Presidio to -6.4° at Crockett.

Light rains fell over many sections of Texas during the first week of September. The Trans-Pecos and the southern counties were missed by the showers. The central and eastern counties received beneficial showers during the second week of the month. The showers were light and scattered over the south and west. Moderate to heavy general rains fell throughout the central, eastern, and southern sections from the 21st to 26th. Local flooding occurred in some south central and southern vicinities. Elsewhere, the showers were light and scattered. September rainfall was unevenly distributed over the State. Several stations in the Trans-Pecos and in the Panhandle received no rain or only light sprinkles. Most stations in those areas received less than an inch. Most Plains stations received between one and three inches. Central, eastern, and southern sections received more than three inches and some areas in the eastern half of the State received more than six inches. Several counties in south central Texas received more than ten inches. The greatest monthly total, 18.41 inches, fell at Flatonia.

Precipitation totals at many stations in the Plains and Trans-Pecos were less than half the long-term means. Some stations in those areas received less than one-fourth of their long-term September averages. At the other extreme, most stations in south central Texas, along the Upper Coast, and in some counties in east Texas received more than twice their September averages. The monthly totals at many stations in the south central division were several times their long-term means.

Small grain and pasture prospects perked up materially as a cold front triggered light to locally heavy showers over a large part of the State during the first week of September. The showers came in time to help the late cotton and feed crops in the northwest. Typical fall temperatures, which held over after the skies cleared, slowed the development of crops in their race against time to mature before the first freeze. The showers over the High Plains were ideally timed to germinate the seed already in the ground. They also provided the moisture for planting the remaining acreage. The rains revived the peanuts in the Comanche-Eastland area and most of north Texas. Showers during the second week of August over the Cross Timbers and scattered areas southeastward improved the wheat, oats, and barley prospects. With the improved moisture over the eastern half of the State, the final preparation of small grain land continued active. Moisture in the Plains was getting away and some spots needed additional rains to bring up the new seedings. Harvest of sorghum for forage and silage was under way in much of the northern half of the State but most growers of
sorghum for seed in the Panhandle planned to delay combi
ing until after the first frost. The rains gave hopes
another crop of hay and possible additional forage fr
second-growth sorghums in the southern half of the Stat

Mild open weather during the third week of September w
favorable for the harvest of mature crops and the plan
ing of small grains. The cool front, which moved dow
state from the 21st to 23d, set off steady soaking rai
south and east of a line from Gainesville to Abilene a
Del Rio just as the bulk of the small grains and wint
legumes was being planted or was ready to plant. T
rains assured quick germination and rapid early growt
The rains tapered out rapidly to the west of the line a
in the Lower Valley. Planting in some parts of the Hi
Plains and in some of the northern counties of the L
Rolling Plains was being delayed because of the lack
moisture to germinate the seed. The cool weather delay
the ripening of the sorghum on the High Plains.

Soaking rains in the south and southeast during the la
week of the month held field work at a standstill b
brought the best fall-season moisture in years. The hea
rain and wind downed considerable rice acreage along t
Upper Coast. After the skies cleared, the fields remain
wet and delayed the harvest. As the fields in the Blac
lands and the northeastern counties dried, the farme
continued their planting of small grains and winter le
umes. In the western Cross Timbers and northwestwa
across the Plains, sorghum and cotton progressed slow
in unseasonally cool but fair weather. Some additior
wheat was planted but most farmers waited for rains b
fore planting their remaining acreage.

Soaking rains over the eastern two-thirds of Texas broug
up the rescue grass, clovers, and weeds and practical
assured lush fall grass and small grain pastures.
south Texas, outside the Lower Valley, the heavy ra
during the last week of September were expected to br
new grass to ease the feed shortage in that area. O
light showers fell over the Lower Valley and heavy s
plemental feeding began again. More rains were nee
in the northwest.

STORMS

Most of the storm damage to crops and property in S
tember resulted from hail and heavy rains. A few of
storms are mentioned below. For more details about th
and for information about other storms that occurred
Texas during September, the reader is referred to C
matological Data, National Summary.

On September 3, hail caused extensive damage to cot
and feed crops over an area over two miles wide and
miles long near Seagraves in Gaines County. On the 6
hail damaged or destroyed considerable cotton in Hall
Childress Counties. On September 10 hail, accompanied
high winds and heavy rain, caused extensive damage
2,000 acres of maturing cotton in Pecos and Reeves Co
ties. On the following day, hail caused extensive d
age in the Courtney-Tarzan area, Martin County. In
minutes the hail caused heavy damage to several thous
acres of cotton. Stalks were stripped, then shredd
Tree limbs were twisted off. Some fields were a compl
loss. Also on the 11th hail damaged 1,500 acres of c
ton near Seminole, Gaines County. In Seminole roofs w
battered, windows broken, signs smashed, and cars
trucks battered. The storm was accompanied by heavy ra
Hail on September 13 caused 50 to 100 percent loss of c
ton, up to 50 percent loss of grain sorghum, and stri
forage crops between Muleshoe and Kress. On Septembe
hail caused extensive damage to irrigated cotton and wh
in Hardeman, Wilbarger, Foard, Hall, and Childress Co
ties. The hail also broke windows, damaged roofs
television antennas, and destroyed the watermelon c
On the 21st and 22d heavy rains damaged rice field
Harris, Brazoria, Chambers, Liberty, Jefferson, Color
and Matagorda Counties.

a DATA RECEIVED TOO LATE TO BE INCLUDED IN DIVISION MEANS.

Much of the data presented in this publication comes from observations taken by volunteer cooperative observers. These observations are mailed after the close of the month to a Weather Records Processing Center, where they are checked for accuracy and completeness and placed on punch cards. These cards are used to prepare copy for the various tables. Printing and mailing is done at the National Weather Records Center at Asheville, North Carolina.

The various steps all take time. Records for any state cannot be checked by machine until nearly all of them for that state have been received. Printing cannot be done until all the tables and the text for an issue are completed and assembled.

Constant effort is made to speed up publication and still maintain high quality of the data. A realistic deadline for mailing the printed Climatological Data has been set as the 15th of the second following month (45 days after the end of the month for which data are published). If any recipient's copy is unduly delayed, the Director, National Weather Records Center, Asheville, North Carolina, should be advised.

A survey has indicated that the comprehensive narrative weather story carried in each issue of Climatological Data is of value to only a small number of recipients. This story will be discontinued, therefore, with the January 1958 issue. A table of extremes will be carried each month and a text will be carried whenever unusual and outstanding weather events have occurred. General weather conditions in the United States for each month are described in the publications MONTHLY WEATHER REVIEW and the MONTHLY CLIMATOLOGICAL DATA, NATIONAL SUMMARY, either of which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C.

EVAPORATION AND WIND

(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER.
MAX AND MIN IN TABLE 6 REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent values published in Table 7 are the water equivalent of snow, sleet or ice on the ground. Samples for obtaining measurements are taken from different points for successive observations; consequently, occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground. Entries of Snowfall in Tables 2 and 7, and in the seasonal snowfall table, include snow and sleet. Entires of snow on ground include snow, sleet and ice.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index shows observation times in local standard time. During the summer months some observers take the observations on daylight saving time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

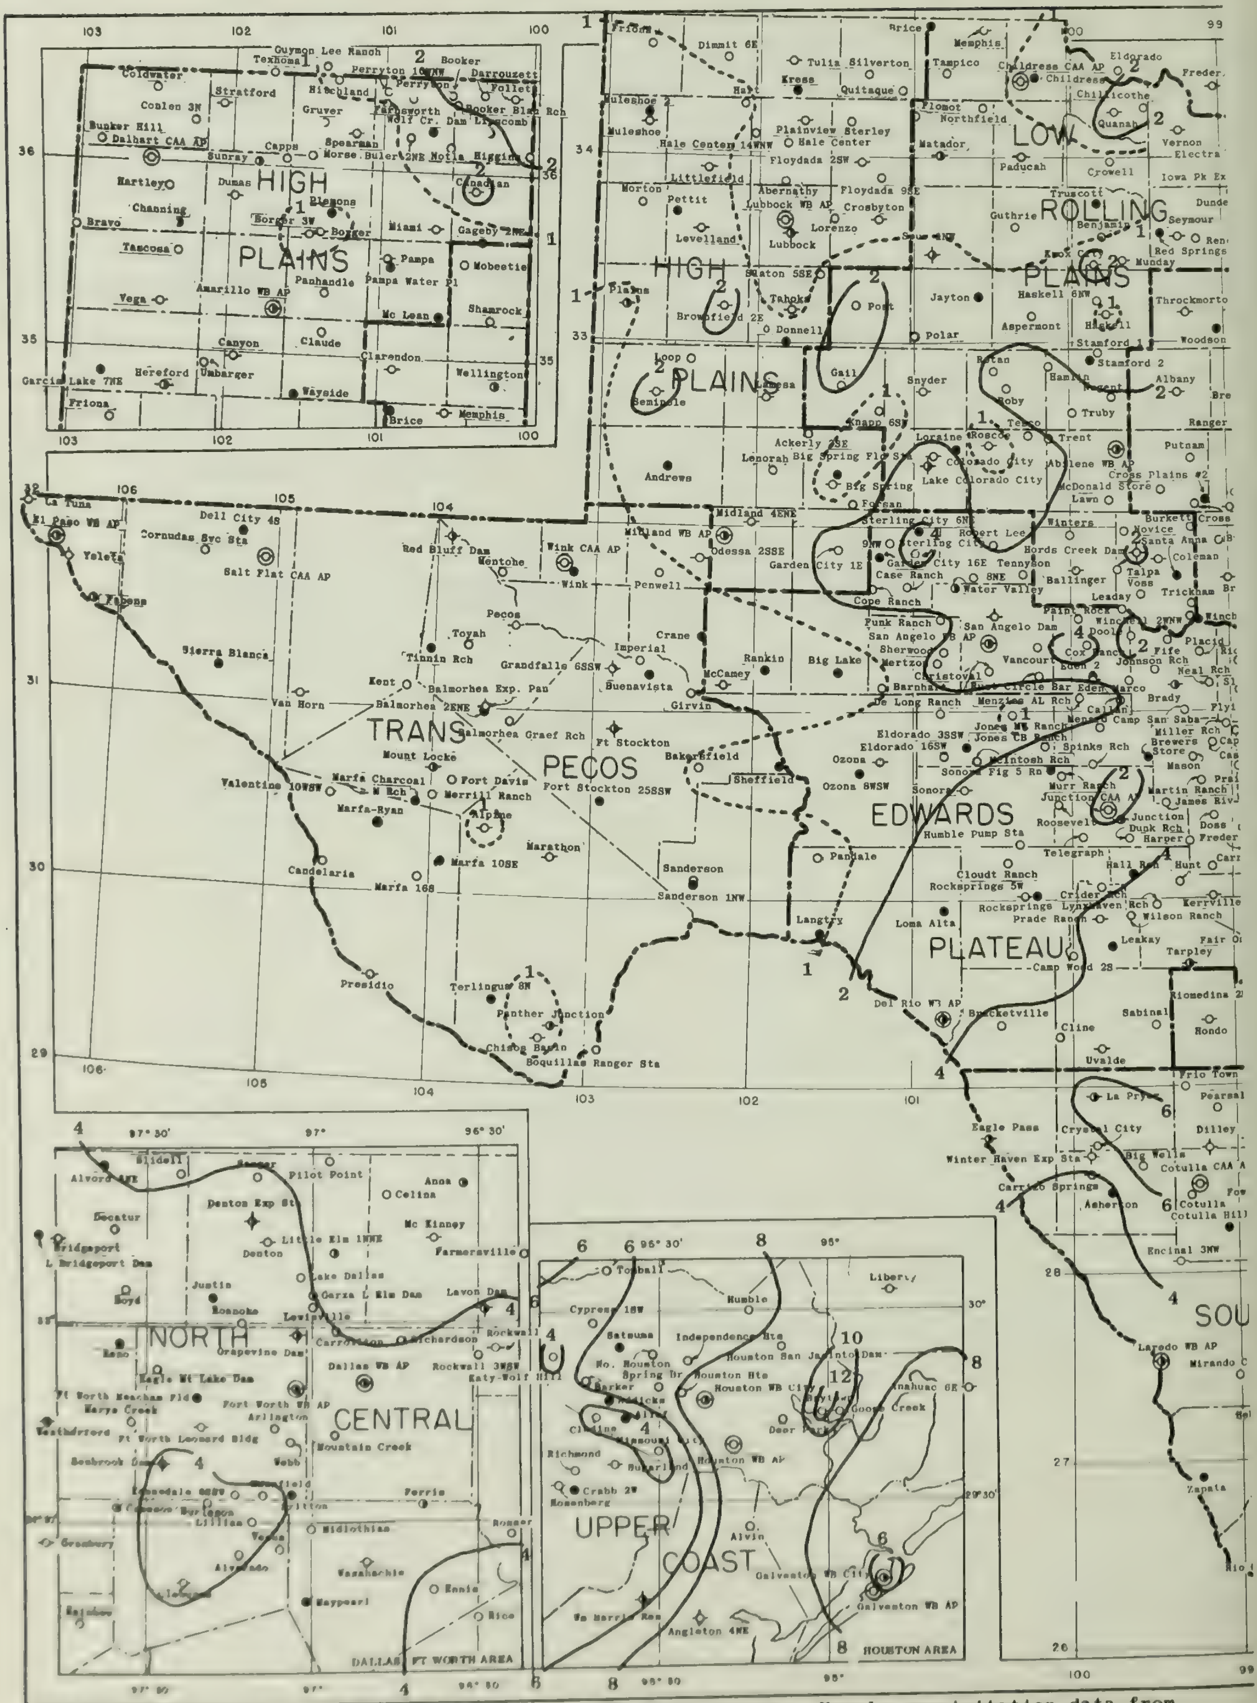
-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; if average value is entered, less than 10 days record is missing. See Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be puslished later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

ubscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annaul Summary.) Checks and money orders should e made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, overnment Printing Office, Washington 25, D. C.

nformation concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation istory" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Simiar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 5 cents.

NWRC, Asheville, N. C. -- 11-7-57 -- 1650

TOTAL PRECIPITATION



Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

WEATHER SUMMARY

Sunny weather prevailed during the first few days of October. The rest of the month, the farmers eyed the cloudy skies anxiously as rain, high humidity, drizzle, mud, and heavy dews kept cotton crews out of the fields and delayed combining the High Plains bumper sorghum crop. Temperatures averaged cooler than usual for October.

The first week of October was mild and sunny over west Texas and the Panhandle. Fair weather, with temperatures near seasonal, was general over other parts of the State. Most stations registered their highest temperatures for the month during the first five days. The principal exceptions were a few stations in the Lower Valley where the 15th was the warmest afternoon. Other mild afternoons were the 14th, 22d, 30th, and 31st. Monthly maximums were generally in the 80's over the eastern sections and in the 90's over the central and western counties. The highest temperature for the State, 100°, occurred at McAllen and Rio Grande City on the 15th. Temperatures were generally below seasonal after the first week except for brief periods which came at the middle of the month, at the end of the third week, and at the end of the month. The period, 23d to 29th, was especially cold. Arctic air pushed the freezing line past all sections except the Upper Coast, Coastal Bend, Trans-Pecos, and southern areas. Record-low temperatures for so early in the season were established at Austin, Dallas, and Waco. The temperature at Austin plunged to 32° on October 28. This was the first freezing temperature to occur in October since the establishment of the Weather Bureau Office there in 1926. Most stations registered their lowest temperatures for the month between October 23 and 29. Monthly minimum temperatures ranged, in general, from the 20's over most northern counties to the 40's over the extreme southern counties. The lowest temperature for the State, 21°, occurred at Spearman on the 26th.

Monthly mean temperatures ranged from 54.8° at Pampa to 76.8° at Port Isabel. Monthly mean temperatures were below the long-term means at all stations except Dalhart and Harlingen. Temperature departures ranged from +0.4° at Dalhart CAA to -7.8° at Bronson. Temperature departures exceeded -4.0° at most stations in north central, south central, and east Texas. Smaller departures were the general rule over the south, west, and the Panhandle. At El Paso, it was the coldest October since 1912.

Typical fall weather, with little rain of importance, prevailed during the first week of October. A cold front produced showers over northwestern Texas on the 8th and over central Texas on the 9th. From the 13th to 15th, a storm system wet practically the entire State except the extreme south and the Trans-Pecos. Numerous stations received several inches of rain from those mid-month thunderstorms. A few stations received more than seven inches in a 24-hour period. Heavy showers again hit the Plains on the 20th. The storm also brought showers to the previously dry Trans-Pecos. The storm spread over the rest of the State on the 21st and 22d. The rains continued over the Coastal Bend and along the Upper Coast on the 23d. Little precipitation of importance fell during the last week of October.

Most stations in south Texas received less than two inches of rain in October. The monthly totals were less than an inch at several stations in the Lower Valley. Precipitation totals were less than four inches over the western counties and the Panhandle. At the other extreme, numerous stations in east Texas received more than 10 inches. The greatest monthly total, 16.25 inches, fell at Rusk.

Several stations in the north central section and a number of stations along the Rio Grande received less than usual rainfall for October. Elsewhere, most stations received rainfall in excess of their long-term means. Rainfall over some central and eastern counties was several times the long-term means.

Typical fall weather during the first week of October was good for field work. After waiting nearly two weeks for rain, High Plains farmers began dusting in their wheat. The rains that came at the beginning of the second week and the torrents unloaded by the storm that hung around for a few days at the middle of the month brought up the dusted-in wheat to good stands. The early sown wheat made good growth. Small grain prospects in the High Plains were very bright. The small acreage of early planted wheat in the low rolling plains came up. Rainy weather and muddy fields stopped the field work over the entire
State. Growers expected to resume planting the remaini
acreage when the fields dried so they could begin to d
stroy the thick volunteer stands.

The October rains came in time to benefit the sorghu
in the northern High Plains. The damp, cloudy weath
between rains was ideal for filling silos but held t
moisture content in the grain too high for combining. T
freezing temperatures on the 26th ended the growing seas
for sorghums in the High Plains. On the whole, howeve
the sorghum grain was mature and the freeze was expect
to lower the moisture content so that combining could pr
ceed. Open weather was needed before combining could co
mence.

Rice harvest had reached the half-way point before t
rains came. Rice combining progressed at a lively pa
during the second week of October and much of the cr
that had been downed by strong winds and heavy rains
September was recovered with little loss. Winds and rai
at the middle of October caused more lodging. The mud
fields and lodged grain slowed the rice harvest during t
rest of the month.

Cotton harvest was completed in south Texas. Elsewher
heavy dews, damp cloudy weather, and showers delayed t
operation. In the central and southern Blacklands, t
rains beat the open cotton badly and caused further r
duction of grades. Hail caused scattered losses in t
northwest. During the last week of October, freezing te
peratures over the Plains defoliated the plants. This w
expected to speed up the opening of the mature bolls. T
freezing temperatures caused the loss of some small boll

Soaking September rains followed by heavier-than-usual O
tober precipitation, produced abundant range and pastu
grass. The fall rains missed the extreme southern count
and dry grass, particularly in the Lower Valley, was ge
ting short. Except in those southern counties and t
Trans-Pecos, winter grass prospects were favorable. Mu
early grass and thick volunteer wheat, oats, and bar
were being grazed. Cattle and calves were going into w
ter in very good condition. There was ample grass
carry them through the winter with little supplemen
feeding. However, a large hay crop was in the bale
a bumper sorghum crop in the Plains country was ab
ready to combine. Ewes were beginning the winter in g
condition. The September and October rains brought w
ter weeds, grass, and small grain pastures along the P
teau and October rains started winter weeds in the Tra
Pecos.

STORMS

On the early evening of October 7, hail and high wi
caused considerable damage to property near Sagerton.
strong winds blew down television antennas and destro
barns and roofs. Hail destroyed cotton. Hailstones
large as baseballs bruised a truckload of cotton picke
Later on the same evening, hail and strong winds dama
crops and property in Baylor, Knox, and Jones Counti
On October 11, hail and heavy rains caused considera
damage to crops in El Paso and Hudspeth Counties.

Tornadoes, other wind storms, and lightning caused c
siderable scattered damage on the 14th. Lightning
stroyed a house in Williamson County. Three tornad
occurred in Waller County. Heavy rain accompanied
storms. The wind ripped a drive-in theater screen, d
aged a house, demolished a church, uprooted trees,
toppled graveyard monuments. Between Waller and He
stead, roofs were torn from buildings, barns were
stroyed, and feed was ruined by rain. The tornado
Liberty County destroyed two houses, several barns,
other buildings. Other houses were damaged, trees w
uprooted, and power lines were blown down. Strong wi
caused lesser damage in Jasper County and lightning
stroyed three oil tanks in Jackson County.

On the 22d, a tornado in Liberty County damaged seve
houses, destroyed a barn and other buildings, and dam
power lines.

For more details about the storms mentioned above
about other damaging storms that occurred in October,
reader is referred to Climatological Data, National
mary.

A survey has indicated that the comprehensive narrative weather story carried in each issue of Climatological Data is of value to only a small number of recipients. This story will be discontinued, therefore, with the January 1958 issue. A table of extremes will be carried each month and a text will be carried whenever unusual and outstanding weather events have occurred. General weather conditions in the United States for each month are described in the publications **MONTHLY WEATHER REVIEW** and the **MONTHLY CLIMATOLOGICAL DATA, NATIONAL SUMMARY**, either of which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C.

FLOODS

A cold front brought heavy rains over the Frio River basin on the 9th causing flash flooding in Uvalde and between Uvalde and San Antonio. Heavy rains from the 13th to 15th over the Gaudalupe River basin caused major flooding along all sections from Gonzales to the mouth. The rains totaled from six to almost ten inches in the three-day period. On the same dates, heavy rains caused flooding over the entire length of the Lavaca and Navidad Rivers.

The heavy rains on the 21st and 22d caused minor flooding along the Guadalupe River from Gonzales to Victoria. the 22d, a squall line dumped heavy rains on the headwate of the Nueces, Frio, and Atascosa Rivers producing bankfu stages but no serious flooding.
